Actual computable quadratic fields F4 / F9
Field axioms, characteristic and cardinalities proved
1,024 / 59,049 general coefficient tuples
F9: generic characteristic-3 square completion
Explicit equation bijection and inverse
All general models reduce to 729 normalized models
F4: generic monic quadratic fibre bound
At most 2 y-values for every x
Positive count ≤ 2q+1 = 9
Nine independent 81-model kernel proofs
Explicit exhaustion of all nine a2 values
No native_decide / classification premise
Actual nonsingular point-group count bridge
Source criterion gcd(q+1−#E,q) ≠ 1
F4 counts {1,3,5,7,9}; F9 counts {4,7,10,13,16}
Actual nonsingular controls: F4 / order 7, F9 / order 13
Both satisfy source trace criterion and exact modular degree 3
Every prime divisor: modular order ≤ 6
Coprime with q and actual prime-order point
Explicit equality-instance Cauchy application
42 declarations pass, 0 failing / 0 trusted-native
Higher extensions and geometric / torsion-field bridges open
57 attempt/source/resource files retained losslessly
Local checking; signed standing unverified
