Actual nonzero f in S[old][E]; E-degree at most D
Actual rotation: S[old][Z][T] -> S[Z][T][old]
D quadratic columns: old-degree 0
2 f columns: old-degree at most d
Determinant old-degree at most 2d
Coefficient at 2d = Res_D(old leading f, S3)
Old leading f nonzero, E-degree at most D
Earlier resultant theorem makes its resultant nonzero
Sharp surviving old-variable degree = 2d
Canonical third-newest: degree 2^(m-2), all m >= 5
