Actual canonical polynomial evaluation
Fixed Sylvester sizes; general Weierstrass model
Polynomial extension
Finite common root OR
both declared leading coefficients zero
Actual point-family extension
Nonzero prefix sum OR
zero prefix sum and opposite last points
Same exact two alternatives
Checked actual S3 / S4 bases
Strong induction: every arity m >= 3
Domain disproof over nonsingular F5 curve
S3(3,1,4) = 0; no rational point with x = 3
Qualified closure theorem remains valid
