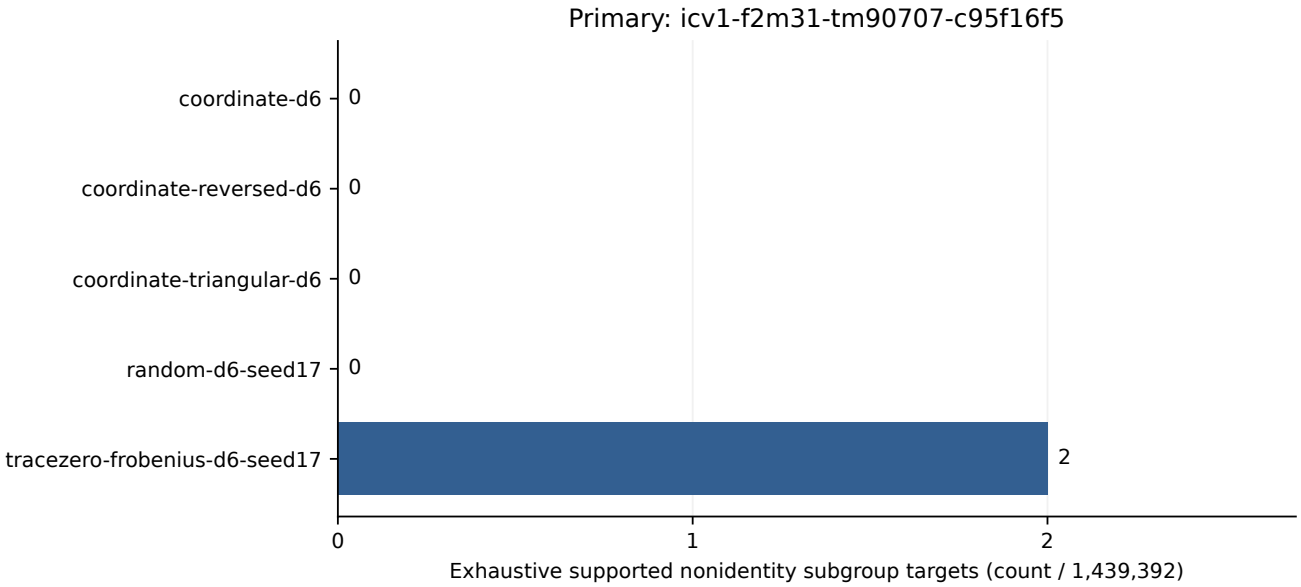
Native screen: primary and secondary

Run group 20261018T0437Z · 2026-10-18 04:37:30–04:37:45 UTC

Source b3ed888964100f1bce4780a4c0500a399c7aee50; executable dd9c1e582effe751777081fc4d7fc6ba1acd90e1696797ef210d20da58c3c3f0. Protocol commit 846cc9433 precedes execution. Plans primary.json (5 cases) and secondary.json (43 cases), seed 2026101801, one thread, degree 8, 2048 MiB and2 million observed matrix cells. Primary30 s/candidate, secondary20 s/candidate. This shared Linux x86-64 host has no timing qualification.

Primary: five completed candidates

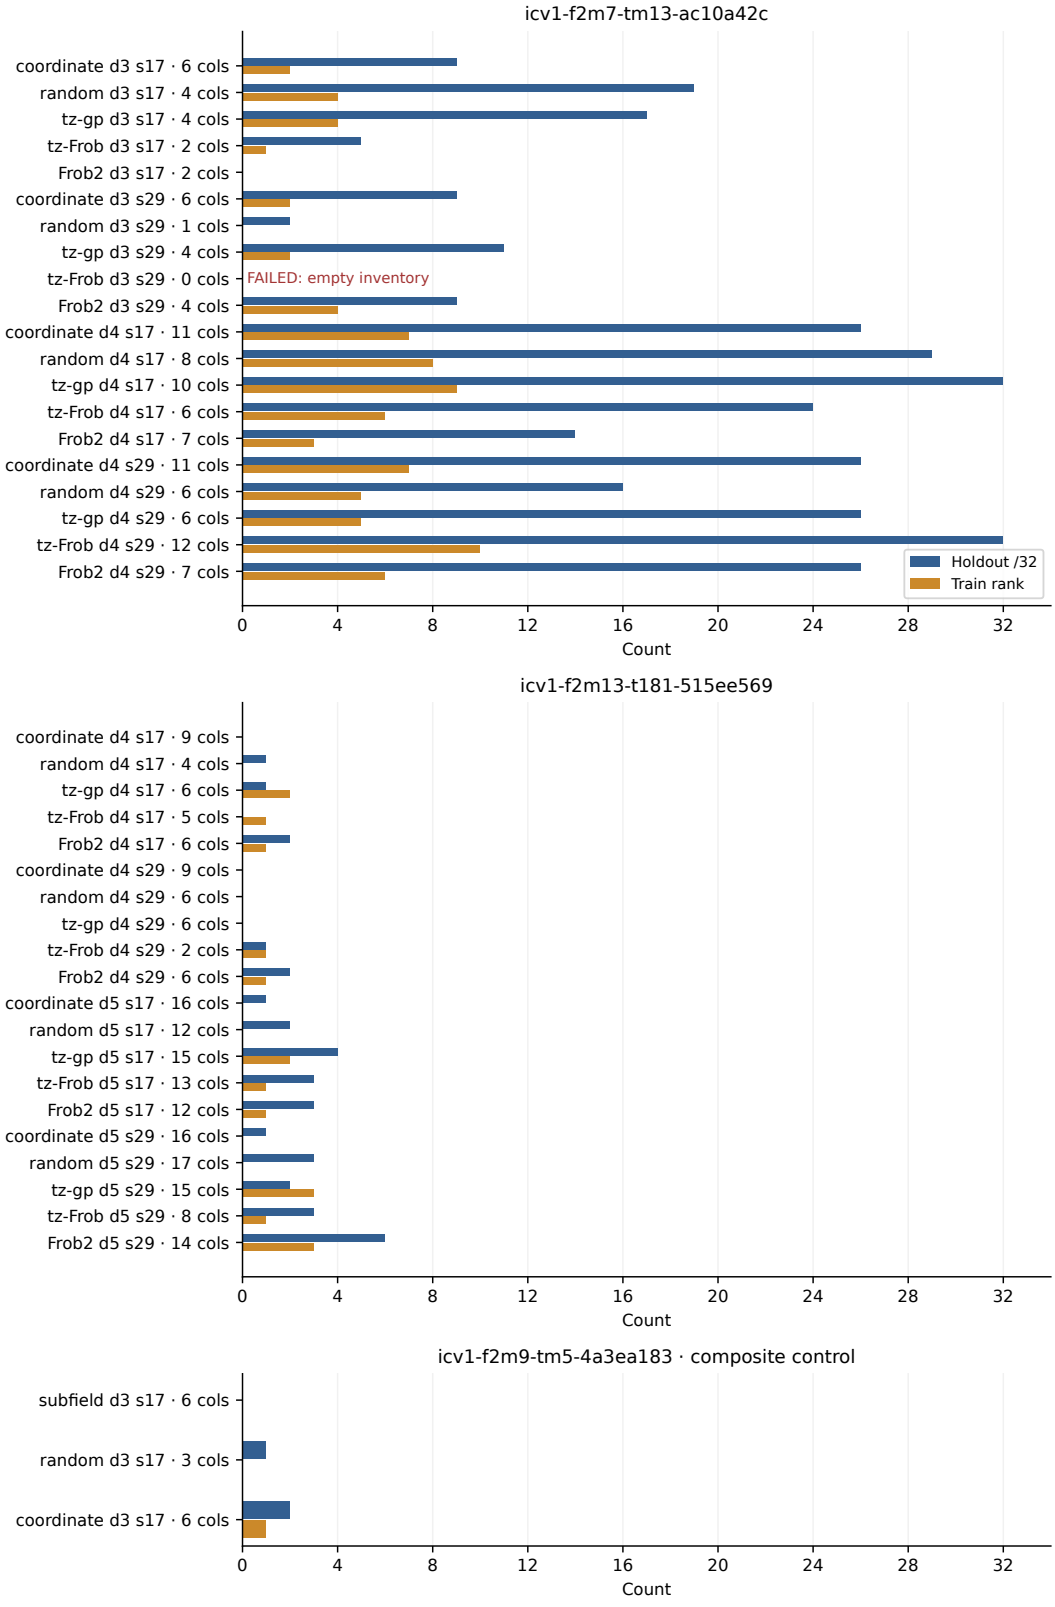


5 sealed candidates; every old whole-curve control passed; 0/24 random successes per candidate.
Coverage is a finite census, not a cheap oracle, regularity certificate or speed result.

Every primary control passes under the original whole-curve scope; no random train/holdout probe decomposes. Exact independent support is shown, including zero-support cases. Actual r = 1,439,393, cofactor 1,492. Coordinate/reversed/ triangular bases have the same signed points; their ordered hashes differ. Positive-control targets can differ, so their costs are not compared. Native verification checks 5 seals and 5 point witnesses.

Raw records: runs/primary, primary.stdout.json, primary.stderr.log and primary.verify.json inside ../../runs.tar.xz. New subgroup-aware behavior is validated separately; these old records are not rewritten.

Secondary: 42 complete, one failed



Screen: target seed 2026101801; 16 train/32 holdout per completed case. Repeated coordinate sets are not new bases.
Different cardinalities are explicit. Counts are descriptive; no uncertainty interval, regularity or speed claim.

Secondary native verification checks 43 seals and 596 point witnesses. The failed dimension 3 trace-zero/Frobenius seed 29 has zero points, not a completed zero-yield run. Full data: observations.json and raw runs/secondary. Base size, duplicate coordinate sets and subgroup model differ; counts are descriptive. Exact support is an audit, not a speed claim.
