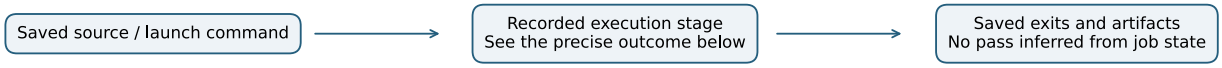
validation: recorded execution

Job 20261023-211022-twist-image-gate-v2-5c8a60. Outcome: done, recorded exit 0. Host class: c7i.2xlarge, lifecycle spot. Started 2026-10-23T21:11:10Z; last status update 2026-10-23T21:54:37Z.

Managed serial correctness gate passed: 4,488 library tests, zero failed, 119 ignored; touched examples passed 1 and 3 tests; native suite passed 57 tests. All six compile/test exits zero. Build separate from unchanged 8 GiB / 1200 s test cap; no algorithm performance timing.

20261023-211022-twist-image-gate-v2-5c8a60



Execution diagram: fewer than two comparable numerical observations. Actual stage and outcome are recorded below.

Command, controls and evidence

Exact command SHA-256: 9e9223083de279433eb16a652d8becde9ae908d9abb69478f41057e7443c4f5d. The command, native raw output, exit receipts, setup/build logs and host metadata are in runs/jobs/20261023-211022-twist-image-gate-v2-5c8a60/ after extracting the content-addressed archive. Job snapshots record the source revision; frozen cold source is bundled separately. The registry specifies all arms, fields and seeds through these commands; the panel protocol and its supplements define the controls and caps.

This job has 0 originating resource-admitted cold-pipeline timed records. Copied checkpoints are not additional samples. A cold graph displays every originating admitted cold record, identified by the native JSON. A diagnostic count graph displays the recorded summary's signed relations and rank/columns, with each population labeled in the JSON; it establishes no wall-time advantage. Replayed summaries are deterministic checks rather than independent targets. Medians and paired ranges used for the final comparison are independently recomputed across complete whole rounds in results/summary.json; a per-record resource pass alone does not admit an incomplete round. The full-column phi-L0 arm is censored consumed cost, not a verified solution. External GB timers are a separate population described by the external report, not included in the cold-record count.

Recorded exit-count map: {"0": 6}. Recorded summary-status map: {}. Recorded independent audit-status map: {}.

Raw observations: results/job-observations/20261023-211022-twist-image-gate-v2-5c8a60.json. Partial JSON records, failed exits and refused isolation are retained in the raw archive. Missing isolation is missing, never an admitted time. No performance conclusion follows from a job's done/0 state alone. Build and test gate durations are not algorithm timings.

See protocol (../../PROTOCOL.md), cost boundary (../../BOUNDARY.md), final report (../../README.md) and raw reproduction (../../ARTIFACTS.md). The msolve job alone measures internal GB timers on 378 fixed systems; it does not run a complete external DLP solver. Other jobs with fewer than two comparable admitted timings use an execution diagram rather than an invented numerical plot.
