Retained N83 K = 16,627: four-summand model capacity

Date: 2026-10-17 UTC. **Curve:** `icv1-f2m83-tm6151469093347-debefd74`. The protocol was committed before the adapter change or run (`PROTOCOL.md`, `CONTROL_ADDENDUM.md`). Raw worker, cgroup and container receipts are under `negative/` and `full/`. Exact source and input hashes are in `BUILD_RECEIPT.md`; the detailed interpretation is in `RUN_REPORT.md`.

Matched input, different caps

Measure	One-variable control	Full-cap model
Status	`UNKNOWN_variable_cap`	`PASS_model_construction_only`
Required variables / domain clauses	201,598 / 5,729,152	201,598 / 5,729,152
Installed variables / clauses / XOR rows	none	201,598 / 5,915,238 / 3,901
Base import	77.488 s	67.294 s
Model construction	skipped	0.325 s
Whole-process cgroup peak	2,661,171,200 B	2,661,126,144 B
Container exit / OOM	0 / false	0 / false

Both runs used the same exact 16,627-column, 2,760,082-point stored object, public target and arm64 worker. The source snapshot binds clean commit `e54bb7d6a930571ad0e68d51c684ec68f65bda88`. Each fresh container had one CPU, 4 GiB hard memory, zero swap, no network, read-only root and a 1,800-second outer wall cap. The negative cap stopped before installation; the full arm built the identity-mask-zero Frobenius-orbit domain. The full receipt reports 62,001 AND gates and three S3 nodes.

What this establishes

This exact retained base can be imported and its m = 4 model constructed under the frozen memory cap. Neither arm ran SAT search, collected a relation, computed rank or performed target extraction. The cgroup peak is whole-process, without a separate model-only memory peak. The workers overlapped other shared-host work; their L0 walls are descriptive and do not form a speed comparison. Construction, replay, storage transfer, search, rank, linear algebra and verification are not combined into a complete IC cost. The IC scoreboard stays unchanged.

Next: check a degree-83 planted four-summand relation on this exact base, then compare natural yield and useful rank with the retained K = 2,048 and structured 2,001-column bases under one frozen corpus.
