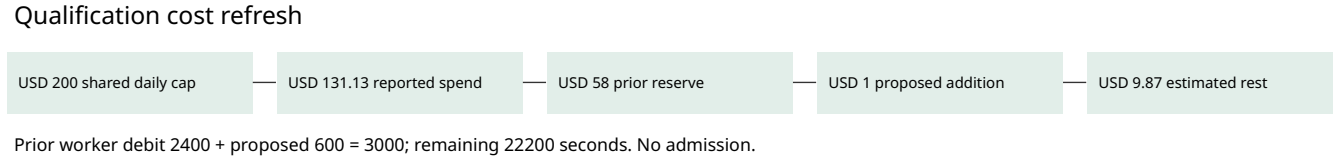
Qualification cost and live-resource refresh

Fresh read-only AWS observations support a proposed additional USD 1 allocation for one 300-second qualification on the retained private runtime. Existing USD 58 reservations remain intact; the proposed total is USD 59, leaving USD 9.87 estimated daily unreserved headroom and USD 590.621 estimated monthly headroom after reservation. Execution is not admitted by this record.



The two daily AWS Budgets both carry the same shared USD 200 allowance, not USD 400 combined. They reported USD 131.13 at 19:48:04UTC and USD 48.79 at 19:56:27UTC. The larger 131.13 is used conservatively. The monthly USD 1000 budget reported USD 350.379 at 19:56:13UTC. The command observation receipts retain exact timestamps around 20:06UTC. The owner-authorized USD 200 replacement is recorded in the checked-in COST_CONTROLS.md of crypto-eks-cost-controls-20261101.

The regional inventory remains three running instances, 49 gp3 volumes totaling 4666 GiB, 60 standard snapshots totaling 6794 GiB, one available NAT gateway and one EKS cluster. EKS reports standard control-plane scaling and EXTENDED support policy. No gp3 IOPS or throughput exceed included defaults. The current host is m8i.8xlarge with a USD 1.69344/hour request cap; a full 300-second host allocation costs at most USD 0.14112 at that cap. The proposed USD 1 also conservatively covers allocation/storage/I/O overhead, using the existing 4 GiB retained filesystem with no new provisioned volume.

The conservative observed regional hourly model is USD 3.41189. It uses request caps,USD 0.08/GB-month gp3, full-volume snapshot upper allocation atUSD 0.05/GB-month, USD 0.60/hour EKS allowance andUSD 0.045/hour NAT standing charge. From the older current daily-budget update through 06:00UTC, the known window estimate is USD 34.797185. This is a refreshed check of the existing USD 55 shared reserve, not an additional charge. Earlier elapsed coverage is not added again or released. The original USD 3 attempt allocations remain alongside that reserve; the new proposed USD 1 brings it to 59.

The campaign preserves 2400 conservatively debited worker seconds. A proposed additional 600 seconds for the 2 CPU, 300-second service leaves 22200 of 25200 seconds through 2026-11-04T06:00UTC. Storage retention is allocated through that same deadline; evidence is not automatically deleted afterward, and continued runtime use requires disposition or further allocation.

The coordinator confirms no newly known competing paid worker or resource commitment from this root/team. Work since the prior reservation consists of ordinary source checks on the existing host, artifact I/O and three recorded private phases. The latest 9.9 MB proof-archive repair uses existing object storage within the prior shared I/O margin. The read-only connector still shows one completed unrelated Job and one suspended unrelated Job, with no pencil Job. Its configured capacity fields are not treated as live enforcement. The Conductor CLI list capped at 200 older rows and is not an accountwide reservation census.

Billing is delayed, and a LastUpdatedTime is not a completeness watermark. Unmeasured variable services, other-region activity and unrelated-team commitments remain explicit unknowns within an estimated margin. The finite USD 59 reservation is a prospective operational envelope, not a mathematical guarantee of accountwide spend. Refresh/reconcile any newly known conflicting commitment before launch; no permission or resource change is included.

Primary references: AWS Budgets documentation, AWS EKS/VPC/EBS pricing, exact AWS Pricing API products and existing request caps retained in the observation archive. Queries used the existing WorkerRole and connector read-only overview. No EKS job, build, container, service or resource was launched or changed.
