Construction and bounded-tail work diagnostics

Same n17/n23 generator systems; baseline, prepared layout/top-degree/linear-tail/direct-packing package, and bounded quadratic-tail package. Every original root set verifies equal. Shared-host native wall values are retained raw but not admitted or quoted.

The n23 complete-root tree uses1022 matrices before,511 with prepared policies and63 with the quadratic tail. The tail also performs4194304 Gray assignments. Those are different work units; fewer matrices alone is not a speed result. Both matrix engines show the same count pattern here.

These diagnostics motivated the frozen dedicated-host runs; they do not substitute for five paired native timings or full DLP recovery. Sources: diagnostic-*.jsonl, frozen baseline and candidate manifests.

Recorded work, including enumeration

Arm	n	Policy	Matrices	Word XORs	Gray assignments
solve-f4	17	baseline	126	2705998	0
