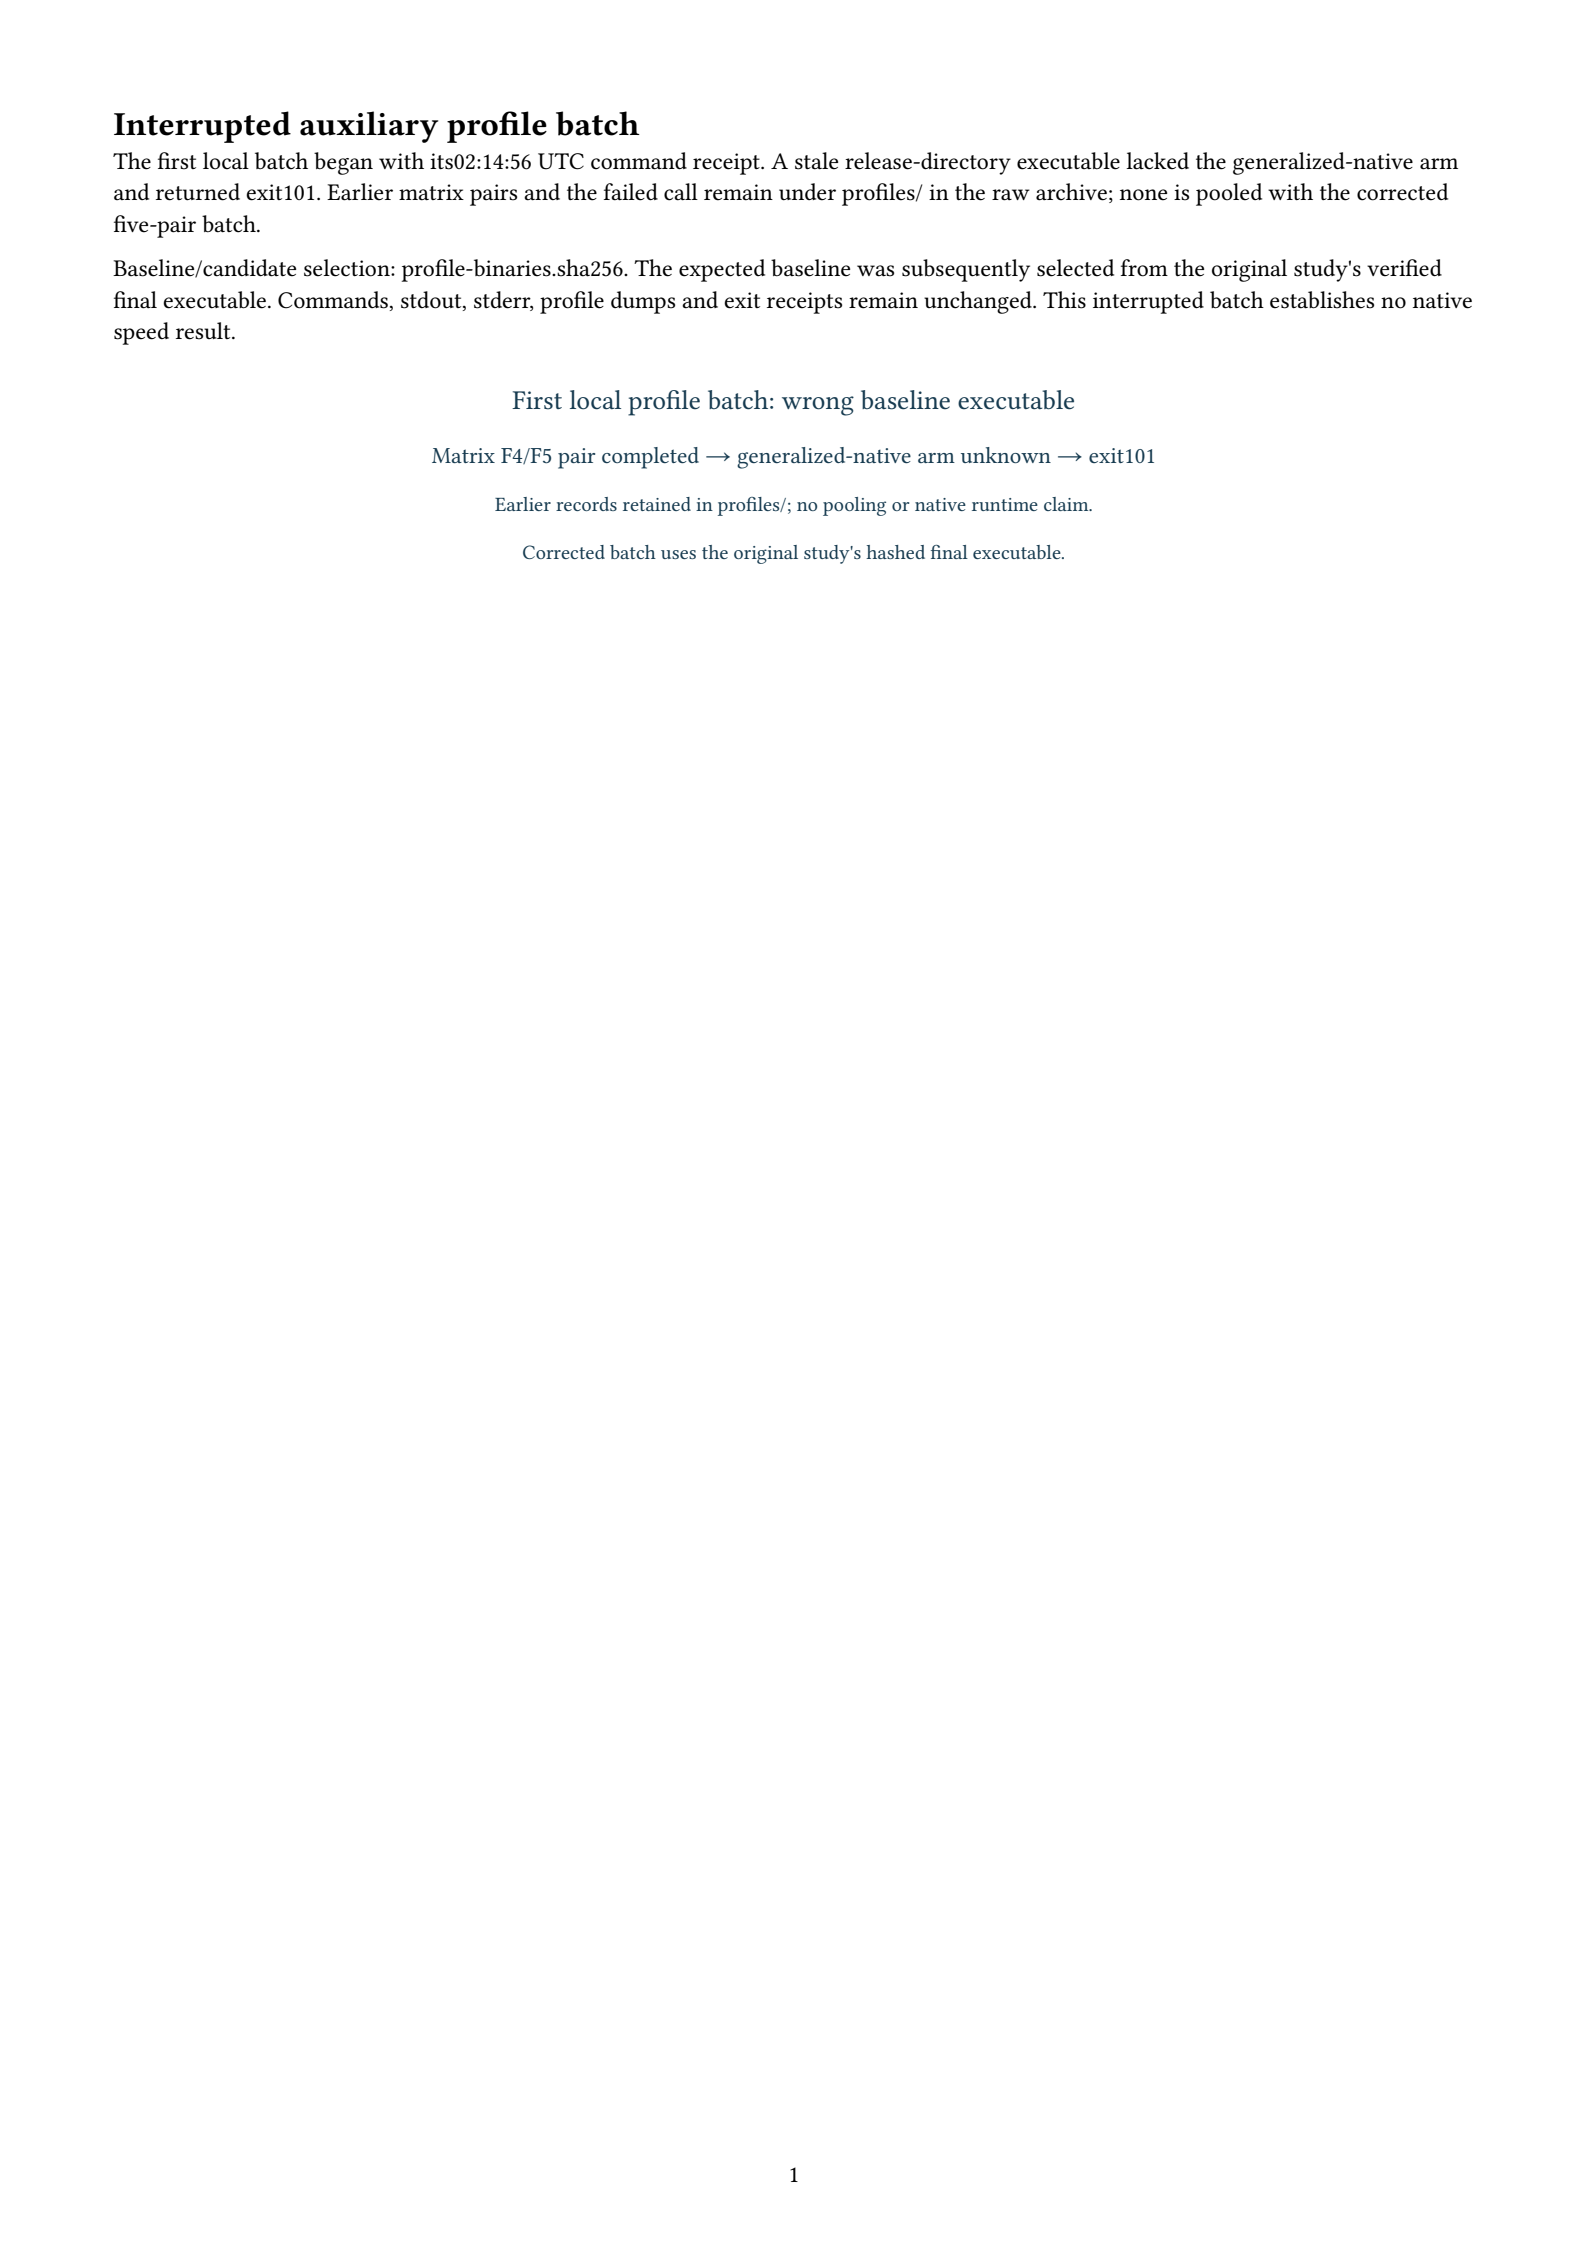
Interrupted auxiliary profile batch

The first local batch began with its02:14:56 UTC command receipt. A stale release-directory executable lacked the generalized-native arm and returned exit101. Earlier matrix pairs and the failed call remain under profiles/ in the raw archive; none is pooled with the corrected five-pair batch.


Baseline/candidate selection: profile-binaries.sha256. The expected baseline was subsequently selected from the original study's verified final executable. Commands, stdout, stderr, profile dumps and exit receipts remain unchanged. This interrupted batch establishes no native speed result.
