Koblitz47 m4 F6 and enumeration campaign

All 16 frozen native cells at $n = 47, m = 4$ have terminal custody. The population crosses geometric F6 and bounded enumeration with both twists, two generators, and two target keys per generator. Every cell produced a verified method artifact; none promoted an independently recovered ECDLP scalar.

Outcome counts

Method	Untwisted verified	Twisted verified	Scalar labels
F6 geometric four-sum	4	4	0
Bounded enumeration	4	4	0

F6 verified:  8/8

Enumeration verified:  8/8

Complete worker instruction labels: 0/16

Evidence and cost scope

The independent audit rehashed 16 restricted archives and 512 native artifacts and checked exact method, twist, generator and key identities. The official export checker reported zero findings on 16 planned and attempted rows, all completed. Producer S3 receipts cover all archives and pointers; separate fresh reads sampled archive indices 0 and 15.

Sixty-four phase telemetry records preserve raw calling-thread PMU readings. None verifies whole-worker coverage or qualifies as a complete training-cost label. F6's private lookup sequence is not exported; bounded enumeration does not certify an exhaustive no-decomposition result. The evidence-linked run report and machine records are in `report/run.md`.
