Independent S3 arithmetic: local result and missing remote arm

The distinct Rust implementation locally reproduces all942models, 4,188,162triples and244,236zeros in the seen C++reference. Zero false/missing zeros; all inverse, base-square-lift and actual point-sum membership checks pass. Each field covers every nonsingular short model and ordered triple. This is a disclosed known-answer replication, not a blind discovery. [pcc:unverified]

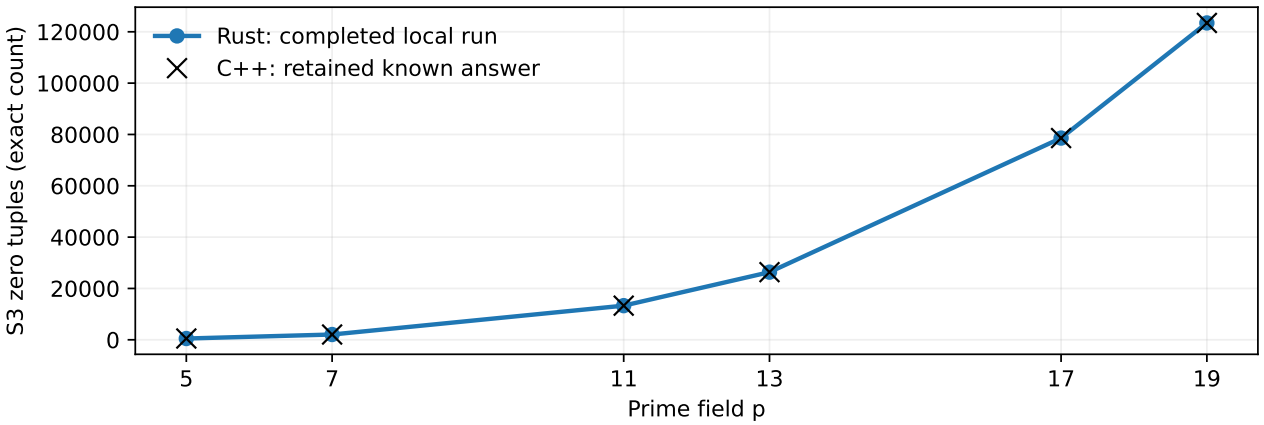

Figure 1: Recorded zero counts from Rust and C++, by prime field. Full six-field population, one completed Rust run. Exact counts; no confidence interval or timing inference. The planned remote arm has no data and is not plotted as zero.

Prime	Models	Ordered triples	Zeros, each implementation
5	20	2,500	496
7	42	14,406	2,052
11	110	146,410	13,300
13	156	342,732	26,352
17	272	1,336,336	78,592
19	342	2,345,778	123,444

Lean proves actual finite quadratic square lifts, AdjoinRoot irreducibility/cardinality and the actual Mathlib point-sum/S3 equivalence under its characteristic/curve hypotheses. It checks chosen prime moduli and the exact F3control54zeros. Gate11pass,0failing,0trusted-native exceptions; PCC-20261109-e789dd passes its full local check but remains unsigned. Compiler/runtime correctness is not formalized. [pcc:unverified]

The single GitHub dispatch returned HTTP404. Workflow and main-file lookups also returned404; no remote host/compiler/binary was provisioned. A missing default-branch workflow is observed, while endpoint permissions may also mask availability. Independent-host validation remains open. The manual workflow was prepared and published, not successfully executed. [pcc:unverified]

Flow2planned/attempted,1completed,1not-completed,0excluded/interrupted/resumed. One local shared host, one thread, no clock metric, zero paid spend. The remote request targeted a standard public ubuntu24.04runner without secrets/EKS/GPU/cache/artifact upload. Approved local checkpoints apply. [pcc:unverified]

Source275f566e and protocol770ee2e5 preceded affected local work; source and freeze published before remote dispatch. Protocol hash prefix44eea2cae6e0. Preflightp3/p23 disclosed and retained; export/file hashes pass. First export commit-binding error is retained and corrected in a new export. No frozen source/data change. Raw records: ../../evidence; exact identities: ../../protocol.json, ../../provenance.json, ../../export.json. General binary/S4/S5/degree proofs and the other original obligations remain open. [pcc:unverified]
