R82: global fraction verifier interrupted

The frozen attempt passed the source/donor gate and entered the full 22-variable standard-basis step. The analyst interrupted it at the previously observed bottleneck. The raw Singular log is empty, the terminal marker is absent, and zero source-fraction identities were checked.

The strict marker gate rejected the attempt. No mathematical result was emitted.

The retained failure motivates a fresh protocol using direct positive membership reductions without a full global standard basis. A nonzero remainder from those reductions would remain inconclusive until separately certified.
