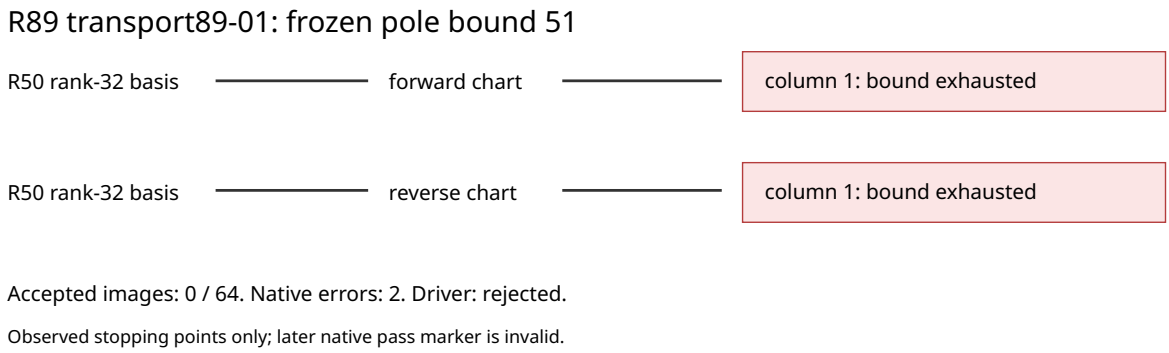
R89 bidirectional rank-32 transport: rejected pole bound

The frozen `transport89-01` attempt stopped at column 1 in both directions with pole-bound-exhausted errors at bound 51. The native log has two Singular errors. Its late pass marker is invalid: the driver rejected the run. There are zero accepted column images out of 64 requested.



The source revision is `a624ea54235799a37e5c2488679d3e1ea7323b5e`. The run used the R50 rank-32 PID basis and R85–R88 diamond maps, seed 89, one thread, 4 GiB virtual memory and a 1200-second cap. The raw archive contains the source and log; all 18 member hashes passed fresh readback.

The post-run bound calculation gives the conservative upper bound 61 from the saved R27 cusp valuations and R50 relative degree. A new frozen attempt must test that bound and stop fatally on the first native error. See `BOUND-ERRATUM.md` and `CM.md` for evidence and derivation.
