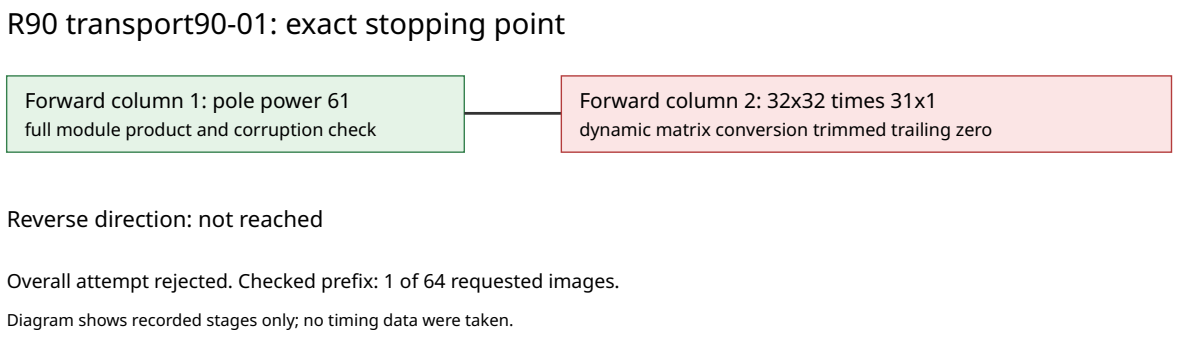
R90 rank-32 transport: bound-61 prefix and dimension failure

The single frozen attempt checked forward column 1 at its first pole-clearing power 61. Its full R50 module product and corrupted-coordinate control passed. Forward column 2 failed when Singular converted a 32-component vector with a trailing zero to a 31-by-1 matrix. The driver rejected the attempt; the reverse direction was not reached.



Source revision: `156f7cbe80488153878fb2a96f711df18faedcf2`. The one-thread native run used seed 90, a 4 GiB virtual-memory cap and a 1200-second cap. All 18 raw archive members passed a fresh readback hash check. A new frozen source must use an explicitly sized 32-by-1 matrix for every extracted power vector. See `CM.md` and `results.json` for the scoped evidence.
