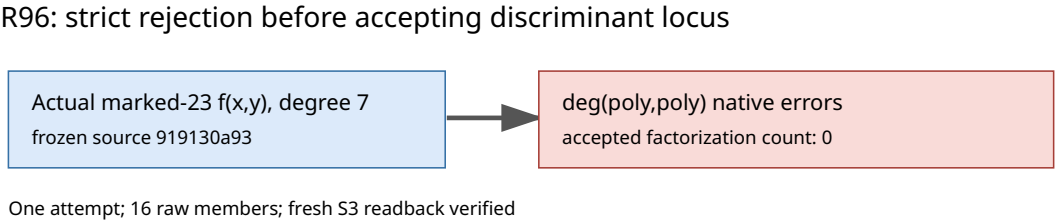
R96 marked-23 discriminant: rejected attempt

The frozen `discriminant96-01` run was rejected. Singular reported `deg(poly,poly) failed`: the source supplied a variable where `deg` requires a weight vector. The process exited zero and printed a pass marker, but the strict driver detected native errors.



The partial export is diagnostic only. A new frozen attempt will use explicit x- and y-weight vectors and repeat the complete source-bound resultant and factorization. The 16 raw members passed fresh-readback hash checks; see `CM.md` for the custody digest and claim scope.
