Run report: the 12 jobs run after the stop, 2026-10-19T16:12Z

Descriptive. What ran and what it recorded. Interpretation is in the study's `README.md` and `REPORT.pdf`. Written at the end of the queue; the audit status is in the study README.

- **Study:** `research/gaudry_quartic_d4_exponent_20261015`, `PROTOCOL.md` amendment 4. These are 12 of the 72 jobs of the original plan; they were not started before the 16 h stop of 2026-10-15 (they are not new jobs) and were run at the owner's request.
- **Specs:** `specs/SPEC-<job>.json`, unchanged since `08722a2b7`. **Binary:** the same `ecbench` (sha256 `8627cd29…0aa3`), not rebuilt. Queue `sessions/jobs4.txt`, run by `run_queue4.sh`, one worker per allowed CPU (0–3), no start deadline; log `sessions/queue.log`.
- **Host:** Claude Code cloud container, 4 vCPU, rustc 1.97.0. Every session ran with `--allow-busy`: isolation earned L0 (7 records) or L1 (5). `S` is a count (`priced_by = counted`) and does not depend on wall time, which is descriptive only.
- **Workloads and arms:** as in the first run report: `fp4_torsion(p, 1, 16)`, `ic-d4-w` (plain, `linalg=wiedemann`) and `ic-d4-lp2` (`large_primes=2`), target seed `2026101500000 + 10p + t`, measurement seed `202610150`.

Runs requested and completed

12 jobs requested, **12 completed, all verified** (`[d]G = Q`). Each session also holds its paired `rho-neg` record (same target, same seed): 12 more verified records, 5 of them on workloads with no earlier rho run (`main-p29-t2`, `main-p37-t2`, `main-p53-t2`, `main-p61-t2`, `main-p197-t2`). Together with the first run (60 sessions) this completes the 72 planned jobs.

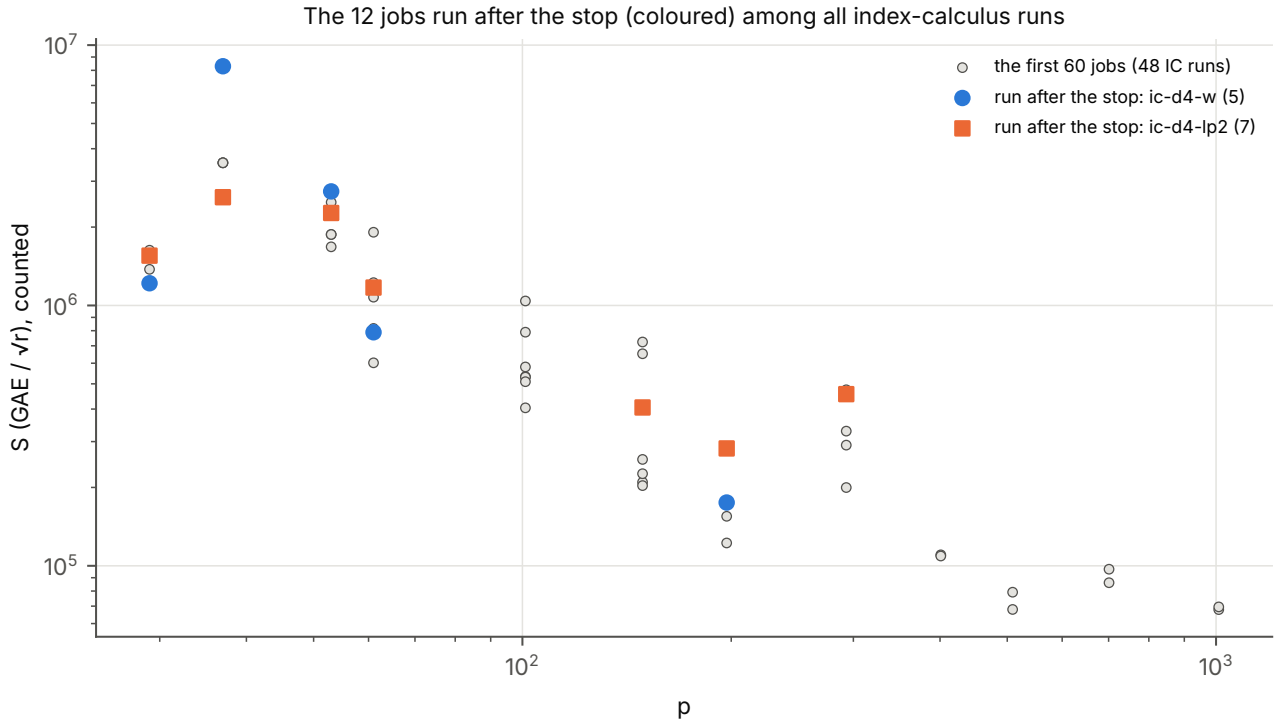

Figure 1: `S` of the 12 index-calculus runs of this queue (coloured) among the 48 of the first 60 jobs (grey). Sessions under `sessions/`.

Index-calculus runs (measured; `S` in GAE/√r, trials counted)

job	session	arm	p	status	S	trials	wall h
lp2-p29-t1	ECBS1hed53a7717567	ic-d4-lp2	29	verified	1553610	519	0.08
