Exact finite operation-counter audit only. Generic decomposition (bounded by sqrt(r); cannot beat rho). Primitive work counters are not independently recomputed; allocator/cache/branch/RNG-internal and byte-peak costs are unpriced. No physical runtime, complete GAE, ECDLP speedup, statistical interval or general-curve claim. Failed selector/rank mass is retained. Audit DP/trie/cache acceleration is not free algorithm work.

Domain: every coefficient model over p7,p11,p19 (531 dispositions); eligible nonsingular prime order >=7; canonical G; B2/B3; length8 candidate words and length8 binary G/Q query words; all nonzero targets. Six actual field control receipts required.

Comparison scope: every rank at every prefix, total unconditional Work and every milestone unconditional Work. Separate exact coefficient-model decisions; counts below aggregate classification labels only, never probability or cost values.

Sources: summary.json, shard-inputs.json, raw model/case/relation records and independent verification receipts; paths, identities, byte sizes and SHA256 digests in export.json. Full exact contrast numerators/denominators: comparisons.json. Editable graph source: graph-data.json. SEC1 v2 section2.2.1. Prior TR01-03 evidence remains separate.
