Theorems compiled; audit failed

Job 20261023-024635-twist-s4-proof-disk-678af3. Native execution and evidence only; no admitted elapsed-time comparison.

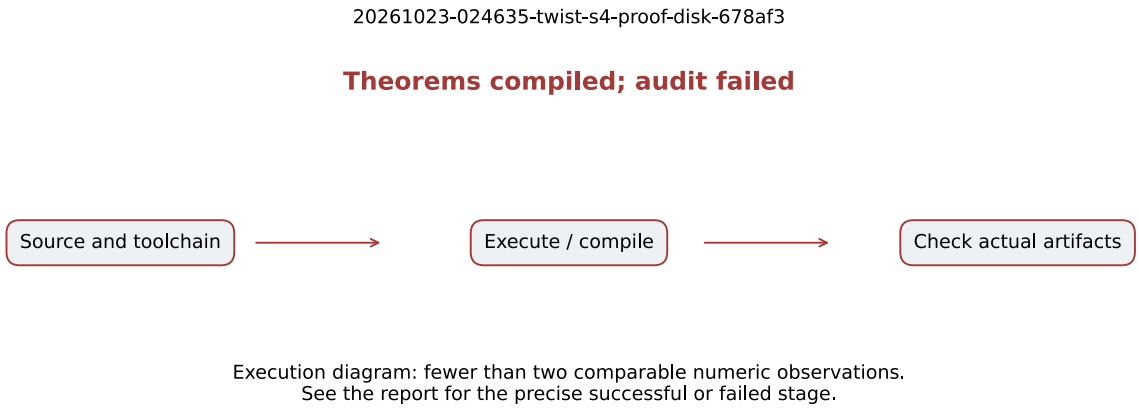
Exact execution

Protocol commits: 509df89c5e, 3ff04c056, 40fbae5a7, e6fc49a7d, as applicable to each stage. The actual executed source snapshot is retained in this job's raw tree.

Host: c7i.large Spot. Started 2026-10-23T02:47:37Z. Terminal phase failed, exit 1. All launched instances terminated. Exact command: command.sh (command.sh), SHA-256 f23bc8c6d70cbf46659650f813b42ae8f6238fdd6815743f306f023b6dc7abee. Host, environment and rusage receipts are in the extracted raw job tree.

Recorded observations

Both theorem artifacts compiled and print only standard axioms. The separate audit failed because its subprocess could not locate lean on PATH. Whole-job exit 1; no audit pass credited.



Execution diagram: fewer than two comparable numeric observations.
See the report for the precise successful or failed stage.

Scope and limits

Structural and collector processes have an 8 GiB address-space cap and 1,200 s watchdog where invoked by the recorded command. Fixed native source and exact raw inputs are retained. No seed or failed stage is dropped. Proof-wrapper setup and extraction do not use the theorem process's cap. Counts shown are recorded native values, with no estimated intervals or timing ratios. F4 row-reduction counters are not complete solver or index-calculus costs. The final prefix A/A checks deterministic output, not timing isolation. Full cost, five-round isolated timing, strongest matched rho calibration and msolve/Magma comparison remain separate uncompleted gates.

Round report (../../REPORT.md). PDF (report.pdf).
