R110: exact degree-7 N51 valuations

5 November 2026 | marked-23 x=1 local branches

Set s=r^7 and u=r^23 v. The initial G equation is v+v^8.

The simple root v(0)=1 lifts uniquely modulo r^40.

y=0: first nonzero N51 term is alpha*r^35.

y=1: first nonzero N51 term is alpha*r^28.

Both orders are below the certified r^40 G precision bound.

Each place has residue degree 2; local zero degree = 126.

Fresh replay, altered-source rejection, independent source rebuild: pass.

Lean finite-order and local-degree arithmetic: pass.

Other finite supports and infinity remain for the global divisor.
