Actual attempt 002 — verified full comparison

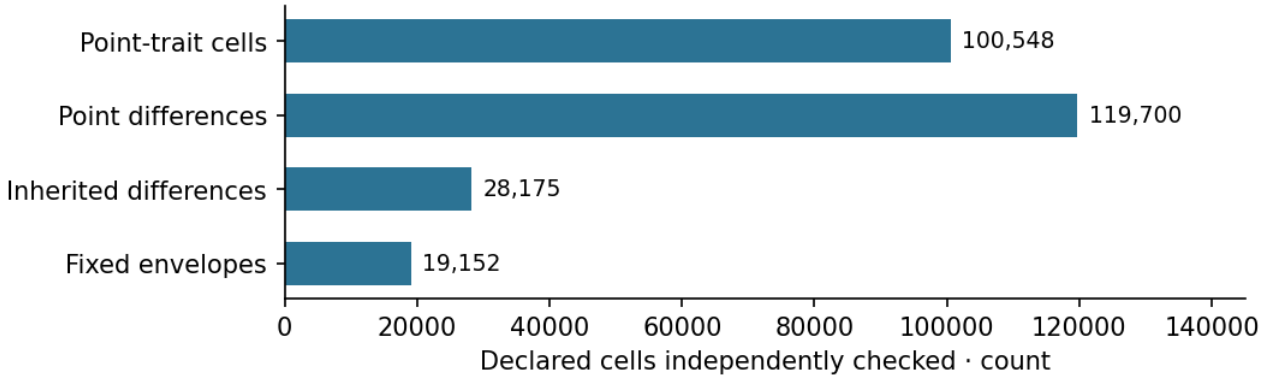

29 October 2026; frozen protocol version 2. Actual launch source: 1b18bec823d730ef8f30ef0761595cac633c411e. The protocol was frozen and committed before this invocation, following the separately preserved first timeout. The original PARI producer and GMP affine verifier, prover, input hashes and finite family were unchanged. All phases used a uniform 1,536 MiB virtual address ceiling with 30/300/300-second watchdogs. An uploaded checkpoint passed before execution.

All three planned phases actually ran and completed with status 0: positive, production and verification. Flow: planned 3, attempted 3, completed 3, not-completed 0, interrupted 0, resumed 0, excluded 0. All 21 original choices (ten published, eleven omitted, six field sizes) remain present. Two coefficient views and fourteen point rules produce 588 point rows; these are controls, not 588 independent curves.

The separate verifier checked 100,548 trait cells, 19,152 fixed envelopes, 119,700 point differences, 28,175 inherited-feature differences and 880 fixed scalar checks, including the headline summary. There were zero exact single separators and zero scalar matches. All eleven historical omitted generators remain textual NA. The 1,127 inherited features were copied with member hashes, and their differences checked; their factorization computations were not rerun here. GMP integer primitives and OpenSSL SHA are shared.

Source: summary, verification, admitted export and raw GET/member receipt. Individual raw tables and executed binaries are in the 106-member full raw archive. Canonical file verification reports zero findings.

Execution was local exact analysis on a shared AMD EPYC 9V74/Linux 6.18.55 host, following the recorded unsupported EKS-contract fallback. No wall/CPU metric, performance isolation tier, statistical interval, DLP or historical attribution is admitted. The graph displays deterministic verified coverage counts, not a security score or performance comparison.

Attempt 002 · all 21 choices · deterministic coverage; categories are different record types
