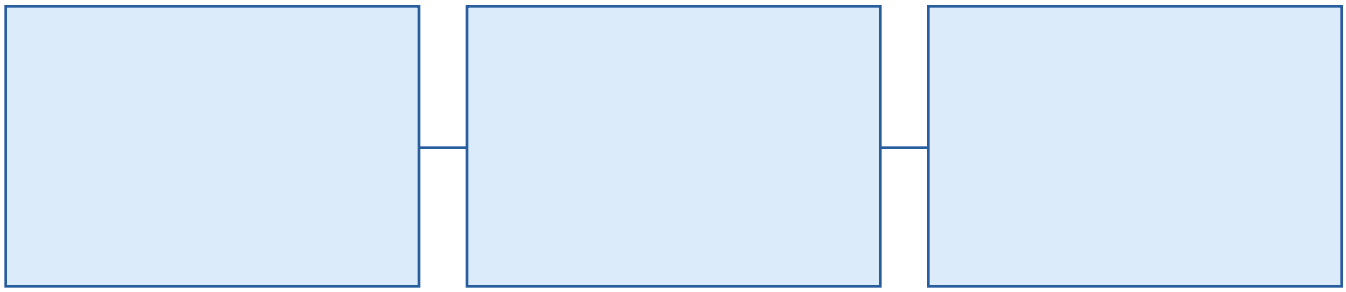
R103: direct marked-23 lambda derivative norm

5 November 2026 | Koblitz modular IC research

The actual G51 has lambda exponents 16, 8, 4, 1, 0. In F2 its derivative is the l-linear coefficient C(x,y). Since G51 is monic degree 16, Res_l(G51,C)=C^16. The direct norm through f51 is Res_y(f51,C)=P123(x)/x^163, with degree(P123)=123 and 74 terms. Its sixteenth power equals the accepted R99 full norm exactly.

Exact direct-to-full resultant relation



Source-bound Singular exited zero without native errors and rejected a changed norm. Fresh replay and an independent GF(2) comparison matched the R99/R100 hashes, numerator exponents, and denominator powers. Lean 4.34.1 checked exponent parity and degree arithmetic. This identity concerns the displayed monogenic order; local integral closure is still required for normalized branch valuations.
