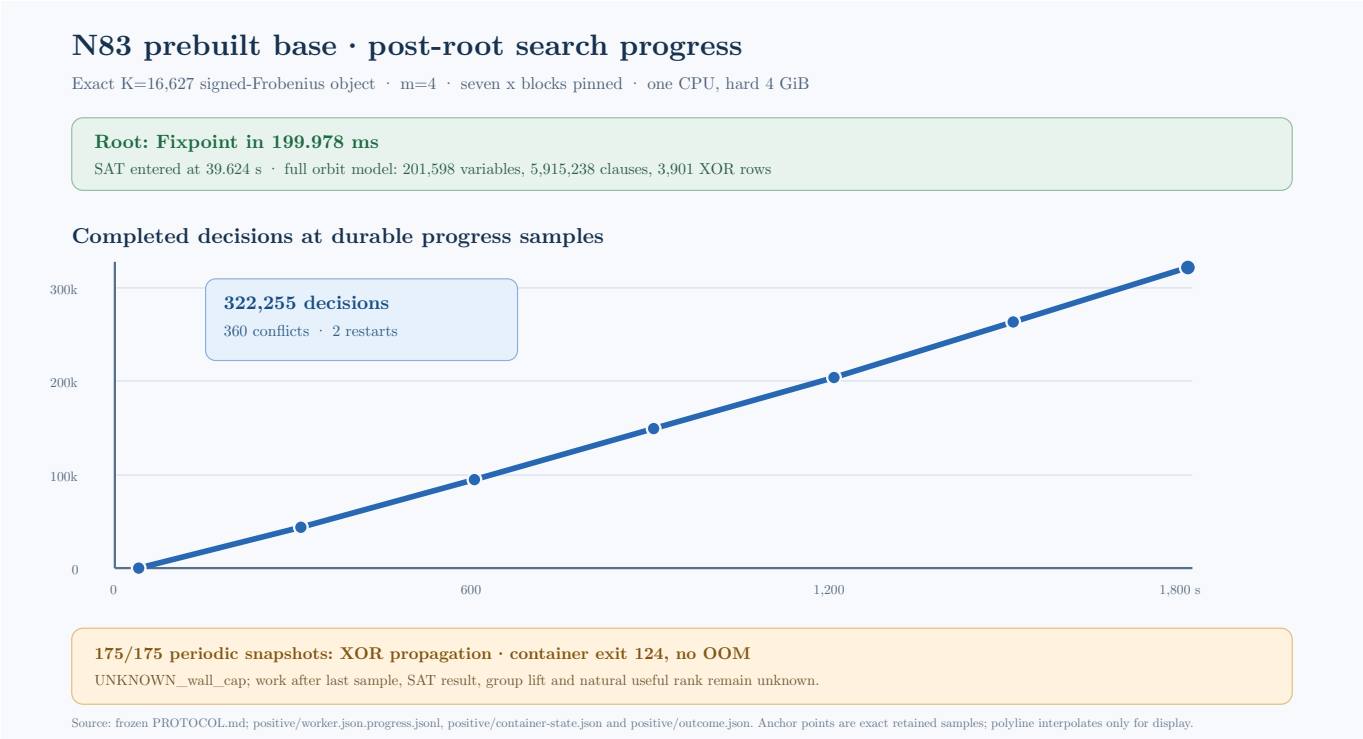
N83 K = 16,627: post-root SAT search progress

Run: 2026-10-18 06:56:55–07:26:55 UTC. **Status:** `UNKNOWN_wall_cap`. The exact retained signed-Frobenius base has 16,627 columns and 2,760,082 points on `icv1-f2m83-tm6151469093347-debefd74`. Source commit `2e1ba2e4763242bb4c8870e22f93b0183c7b30f7`, six-file and input SHA-256 manifests, frozen protocol, build receipt and exact commands are retained beside the complete `RUN_REPORT.md`.



Frozen positive arm

Measure	Observed value
Resource envelope	one CPU; hard 4 GiB; zero swap; 1,800 s cap
Full m=4 model	201,598 variables; 5,915,238 clauses; 3,901 XOR rows
Root propagation	`Fixpoint` in 199.977792 ms; zero decisions/conflicts
SAT entry	39.623697 s process elapsed
Progress	176 fsynced samples; all 175 periodic phase samples in XOR propagation
Last complete sample	1,792.112144 s; 322,255 decisions, 360 conflicts, 2 restarts
Outer result	exit 124; no OOM; 2,662,309,888-byte peak

Interpretation

Decisions increased after root, so this worker repeatedly entered solver search. Periodic phase snapshots consistently landed in XOR propagation; they do not establish an exact CPU-time fraction or identify the costly inner XOR operation. Work after the last sample, SAT result, returned model, checked group lift and returned-relation rank remain unknown. The dependent unpinned arm was not attempted. A pre-SAT rank-one group check is not a natural-query useful-rank measurement. No m=2, m=3 or m=4 base is selected, and no complete cold index-calculus cost or matched-rho ratio is reported.

Raw source: `positive/worker.json.progress.jsonl`, `positive/worker.json.phases.jsonl`, `positive/container-state.json`, `positive/outcome.json` and `positive-files.sha256`. The next frozen experiment should observe completed XOR-pass timing and row work before testing a solver policy change.
