Actual pinned Mathlib Dirichlet theorem
q=24, a=5, coprimality proved
Prime p > 24B+5, p congruent 5 mod 24
Actual division/remainder identity
t=p/24 > B; n=24t+5=p prime
Genus parameter g=12t+2 and order n exceed B
Frozen actual polynomial arithmetic over F3
All-pair normalized Cantor certificates before group transport
Actual cardinality n, generator (X,1) has order n
Every member is generated
Unbounded prime-order arithmetic groups
Every member smooth: fraction 1
Full valid-pair ambient fraction strictly smaller
Counterexamples beyond every prime-order bound
Direct universal prime-family equality negation
5 declarations pass, 0 failing / 0 trusted-native
No assumed Dirichlet or prime-infinitude axiom
Fixed F3; genus grows with order
Full ambient / geometric Picard bridge remains open
Signed standing unverified
