Supplied actual F,H,V, branch and degree bounds
All target coefficient cofactor equations
Actual nonzero adjugate column
Kernel membership and exact radical direction
Every actual norm residual coefficient is zero
Finite equations + degree bound reconstruct polynomial
Zero norm would force F to divide H
Bezout inverse + branch guards + degree gap
Full norm = c G, c nonzero
Even-chart normalization c = alpha^2
Fixed F,H,V,branch gives fixed rank
Only one monic target satisfies all coefficient equations
Still missing: efficient public-input certificate finder
Divisor/scalar bridge and uniform total bit complexity
