R114: radical x=0 lift repeats square residual

5 November 2026 | exact marked-23 degree-7 base equation

Set x=r^2, v=r^3(1+h); divide R113 quotient by r^6.

The 74-term quotient has special fiber h^2.

Its lower hull: (0,3), (2,0), (3,3), (7,31).

Positive slope 3/2 again has residual 1+T^2.

The residual is (1+T)^2, repeated in characteristic two.

Next: use t=v/x in the original separable branch.

Fresh replay, altered-source rejection, independent donor composition: pass.

Lean finite support arithmetic: pass.

The normalized place count and N51 valuations remain open.
