Two-dimensional invariant-space census

Run ID: `run-20261022T0621Z-quartic-2d-census`. Intel Xeon 6975P-C, 32 logical CPUs; shared-host L0. Every nonzero `a+b t²` was tested on eight canonical quartic twists. The independent norm and point-orbit audit passed on all 265,008 candidates.

p	two axes	interior	full base	signed pair entries
13	0	72	72	5,112
37	48	576	624	388,752
73	96	2,448	2,544	6,469,392
97	72	4,464	4,536	20,570,760
157	192	12,384	12,576	158,143,200
229	192	26,424	26,616	708,384,840
241	192	28,512	28,704	823,890,912
337	360	56,016	56,376	3,178,197,000

Every nonempty abscissa orbit has size 12 and signed point orbit size 24. The p=13 empty-line control has 72 interior abscissae. Pair entries are a derived construction count, not measured memory. Source, commands and raw files are linked in `README.md`.
