Runtime preparation: component outcome

2026-10-31. Local image assembly completed by adopting the previously built base and building the runtime layer once. No base rebuild occurred. The original permission failure remains retained.

Qualification observations

Q0 passed: executable, runtime and metadata bytes, modes and selected ancestor metadata were checked. Q1 produced the expected positive report and process exit zero. Its gate observed PID 1, UID/GID 1000, pids.max 1 and pids.current 1 before tested-program execution.

The qualifier then failed its empty writable-layer diff assertion. The exact additions were `/fixtures`, `/qualification`, and `/qualification/exec-gate`. Q1 was not promoted to a passed case. Q2, Q3 and Q4 were not completed. Container cleanup completed.

Next reviewable step

Account prospectively for the three observed mount-placeholder paths while preserving the distinction between daemon mount setup and program writes. The failed empty-diff assertion remains failed. No amended qualification has been executed.

No scientific payload was launched. Remaining worker allowance and cohort cost ratios remain null. The companion `status.json` binds native receipts and exact diff by SHA-256; `flow.svg` provides the editable diagram. This report does not replace independent runtime review.
