R94 principal-open overlap bridge

The frozen `overlap94-01` run checked seven named functions in the accepted rank-32 source algebra. All 224 polynomial coordinates, the full module products, both mapped overlap-unit identities, and two corruption controls passed. A fresh S3 readback replay checked all seven named vectors and the full matrix product.

The identities $h^2 = uH$ and $k^2 = uJ$ make u a unit on either principal open. The chart maps send the opposite overlap unit to $1/u$. Combined with R91 generator membership and R88 inverse composition, this gives the overlap-ring bridge for the accepted rank-32 algebra. The proper boundary identification and modular-factor action remain separate checks. Source revision: `3c2ad242a`; raw archive SHA-256: `79a58d0709cc09d4...fd56710ffc6dfccc`.
