K4405 load80: capped local control

Run 20261020T1604Z - one attempt; zero completed index or target receipts.

The release process reached its 3,600-second cap while this control had not produced an index or target receipt. A process sample at 16:24:07 UTC observes root-index construction. The completed capacity, exact output, and performance of load80 remain unknown. This report preserves an existing run; no new experiment was executed to prepare it.

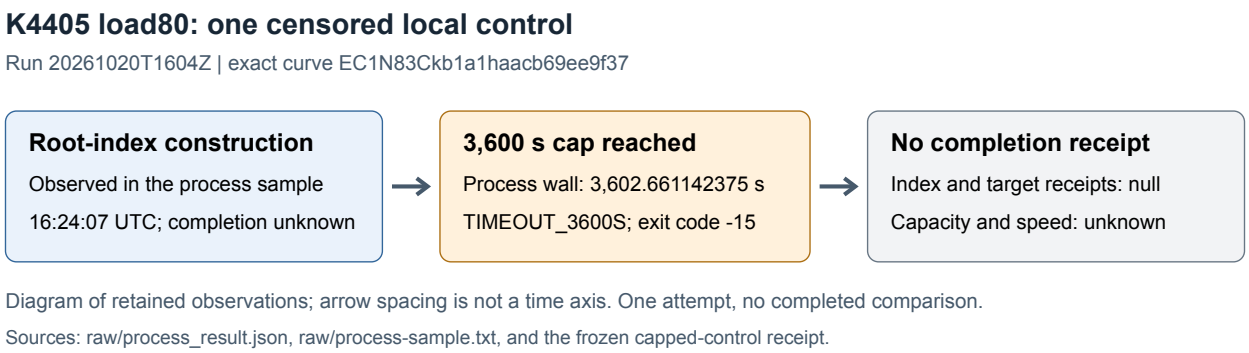

Figure 1: Retained stages of the censored attempt. There are fewer than two comparable completed measurements, so this explanatory diagram replaces a quantitative comparison graph. The horizontal spacing is not elapsed time.

Measured observations and configured limits

Quantity	Recorded value and scope
Process status / exit	TIMEOUT_3600S / −15
Process wall, measured	3,602.661142375 s; termination interval, not solver throughput
Sampled peak RSS, measured	13,126,172,672 bytes; sampling is not a bound on an unobserved peak
RSS cap, configured	27,917,287,424 bytes
Time cap, configured	3,600 s
Outputs retained	stdout, stderr and target-output files are each zero bytes
Index / target receipts	null / null
Replicates and uncertainty	One attempt; no spread or confidence interval recorded

Workload, host and interpretation

The exact curve is `EC1N83Ckb1a1haacb69ee9f37`, K = 4405, load = 80. The command invokes `koblitz_orbit_dlp_fast construct:83:1:4405` on the retained public target with command argument `29`; the full command and all environment flags are in `raw/input.json`. Its expected scalar is 8171303969165027. No complete output exists for an equality check.

The sample identifies ARM64 and macOS 26.6 (25G70). No host isolation attestation or matched load75/rho control is retained for this attempt. The sample's physical-footprint figure and the controller's sampled RSS are different counters and are not substituted for each other. The elapsed time is a censoring observation; it establishes neither a speed ordering nor a completed capacity measurement. K4500 and K4549 are not promoted by it.

Identity and independently retained provenance

The original capped-control JSON is unchanged. Its source commit is `a2bbdaafcdd7de8a729643122daffa2cdfc8124e`, with example SHA-256 `716b4a688c23e4c02d852a6bfc5fca90d706ed3d4a922aec4894416e147ab9d4`. The binary SHA-256 is `ed7404b6be0f63f5e237553703ba3ca3ce4e7afa32cf0004c76035fd4f72caa9`. Both were checked against the historical Git source and local executable while assembling this package. The executable remains external; it is not embedded in this report or committed here.

The files below are copied byte for byte from the original local paths and match the hashes already pinned in the receipt. `provenance.json` records the complete file hashes and sizes. This verifies the binding of retained bytes; it does not independently rerun the capped computation.

Retained file	Bytes
`raw/input.json`	1654
`raw/process_result.json`	177
`raw/target.jsonl`	58
`raw/stderr.log`	0
`raw/stdout.jsonl`	0
`raw/targets_result.jsonl`	0
`raw/process-sample.txt`	69899

Frozen dispatch and canonical figures

The associated two-point protocol records that its former Pod was absent at 2026-10-20T15:58:56.317004Z. Its existing deadline check rejects dispatch from those frozen bytes. A future comparison needs a new allocation/protocol, an authorized budget, complete capacity receipts, and a provider-absence watchdog. This report does not allocate infrastructure.

The study's `capacity_projection.json`, canonical IC scoreboard, `docs/ic/progress-timeline.json`, and performance-gains figures receive no new point: the attempt yields no admitted completed performance comparison or new curve/map identity. The retained timeout does not change the previous load75 candidate identities. No benchmark performance row is warranted by these bytes.
