Job 20261023-020454-twist-s4-structure-v2-afc5d6. Native execution and evidence only; no admitted elapsed-time comparison.

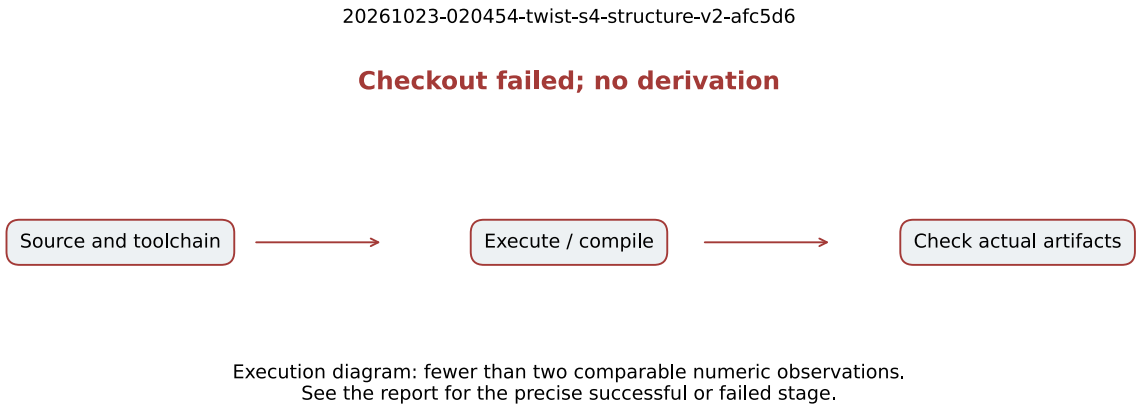
Exact execution

Protocol commits: 509df89c5e, 3ff04c056, 40fbae5a7, e6fc49a7d, as applicable to each stage. The actual executed source snapshot is retained in this job's raw tree.

Host: c7i.2xlarge Spot. Started 2026-10-23T02:05:52Z. Terminal phase error, exit None. All launched instances terminated. Exact command: command.sh (command.sh), SHA-256 093184d879b191511abcba062b08e0847a55213d2c3604699cd0111ba4e0d538. Host, environment and rusage receipts are in the extracted raw job tree.

Recorded observations

GitHub requested credentials unavailable to this runner. The probe never compiled or executed.



Scope and limits

Structural and collector processes have an 8 GiB address-space cap and 1,200 s watchdog where invoked by the recorded command. Fixed native source and exact raw inputs are retained. No seed or failed stage is dropped. Proof-wrapper setup and extraction do not use the theorem process's cap. Counts shown are recorded native values, with no estimated intervals or timing ratios. F4 row-reduction counters are not complete solver or index-calculus costs. The final prefix A/A checks deterministic output, not timing isolation. Full cost, five-round isolated timing, strongest matched rho calibration and msolve/Magma comparison remain separate uncompleted gates.
