Qualifier v5: unique gate receipt

One additive assertion rejects the gate schema identifier anywhere in stdout or stderr after the first validated receipt. This closes the independent review finding while preserving sealed v4.

Q1 requires complete parsed JSON equality. Q2/Q3 require the expected exit, rejection substring and absence of positive-report or further gate schemas. Complete negative byte equality is not claimed.

AST parsing passed; no Docker or native execution. The original caps and pending bindings remain. An unexpected file-bind parent in the container diff would still fail closed; this is an operational possibility, not an observed result.
