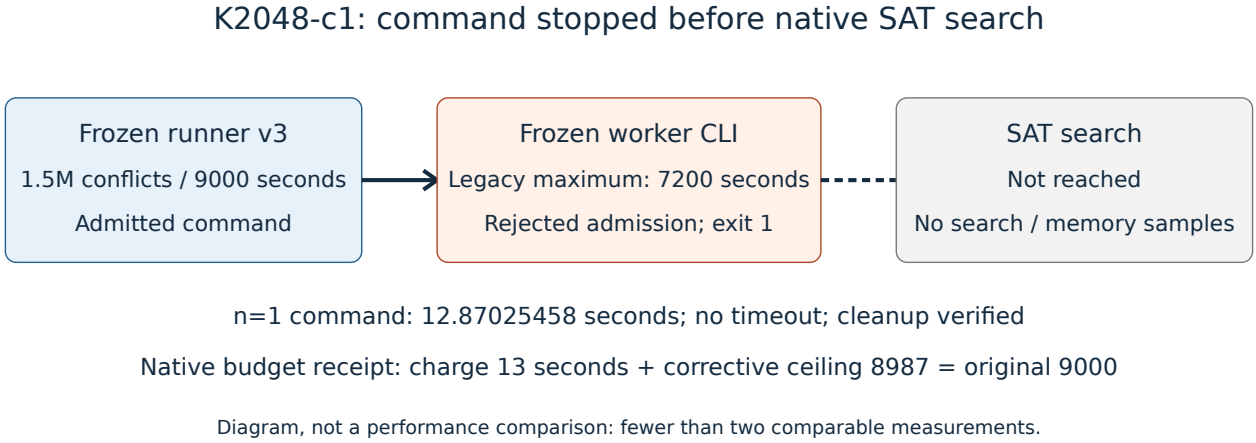
N83 K2048-c1: pre-search admission refusal

Run2026-10-23T04:44Z. Frozen source a591f1daa3f26628ac1dadb0561acd366ef61ca2. One public N83 K2048 orbit-chain workload, m5, seed2026100801, one target; requested1.5M conflicts /9000worker seconds,8GiB/swap0,one CPU quota, core14/30 worker14. Original image, fixtures and panel; command ceiling10200, lock queue600. See REPORT.md and the immutable raw card/spec/source archive.



The command ran once, exit1, no timeout. Whole-command12.87025458seconds is recorded diagnostic accounting, n=1,no uncertainty; algorithm time is missing. Worker CLI rejected its requested budget above7200seconds before SAT. Stdout and memory-profile are empty and no run directory exists. Runner subsequently reports an empty memory profile. Docker OOM=false; outer and systemd runtime cleanup pass. The director verifies argv, relay and custody and recommends respecification. It does not interpret a solver result. No search result exists.

Correction within the original allowance

Native accounting binds the original receipt/config/outer/stderr and rounds the entire refused command upward to13seconds. The same original K2048 slot has8987seconds left. K4096 retains9000. The four-workload ceiling is unchanged: 6000 +6000 +13 +8987 +9000 =30000worker seconds. No transfer, automatic retry, or new allowance. K2048-c2 requires a separately frozen and verified card.

Worker admission now accepts only the exact additional natural-orbit m5, unordered pairs (K2048,1500000,8987) and (K4096,1500000,9000). Legacy admission and SAT/arena code are unchanged. Validation:21exporter,43guard and7card tests pass, including the actual CLI path and fail-closed refusal accounting. The new worker hash is0cfb0d19 and guard hash e11f22b0; full identities and raw validation streams are in verification/native-arena-reclamation-20261023.

Limits and evidence

The corrected continuations have not run at this report freeze. They still require native audit, full matched1Msearch-prefix comparison, all storage and memory checks, and independent custody assessment. Prior accepted1Mresults are preserved separately. No UNSAT, base selection, minimum-memory, speed, fastest, recovery or rho claim. No comparable algorithm values exist; the figure is a gate diagram. Canonical graphs listed in REPORT.md remain unchanged. No eligible leaderboard or benchmark row follows from this failure.
