## Audit gate passes; source-block oracle scope corrected before use

external-audit-v2 compiles its test binary and passes 75 native tests, zero failed or ignored. It was then explicitly stopped while its busy wrapper waited to invoke the runner build. The inspected service cgroup contained only the shell driver and waiting Python wrapper; no runner compile or external-basis audit had started. Original test outputs, source hashes and the stop reconciliation remain in its run metadata.

Source review caught an oracle-scope error: a basis for a single source block must be compared with the subset of physical relations admitting a source in that block. For mixed arms this is the image factor's source. For pure L0, the same physical four-tuple can have several source presentations; the actual positive fixture has presentations in all three blocks. Comparing a block with an unrestricted oracle could falsely label a complete block as incomplete.

The correction is accompanied by a test using actual p37 public points and frozen independently audited pure/phi relations. It verifies their group sums, the pure tuple's three allowed blocks, and the phi tuple's single T=10 source block. The fresh version-3 gate passes all 76 native tests, zero failed or ignored; the saved test execution reports 8.47 s, which is an unadmitted diagnostic and not a solver speed comparison. No external result is accepted from the stopped version, and no msolve computation or signed-set oracle is repeated by this correction.

The independent external checker separately verifies input reductions and all S-pairs, exhaustively branches over the basis's Fp variety, decodes physical factors and signs, checks group sums and independently reduces matrix rows. Input containment and S-pairs do not establish reverse ideal containment. A dedicated false-unit-ideal control preserves that limit; complete physical sets require equality with the independent group oracle. The software gate is not itself a successful external solve, complete collector or timing result.
