Additive retry clarification review

31 October 2026 UTC. Original proposal and original independent review remain unchanged. Source and parent hash bindings match.

Clarified eligibility. Initial attempt plus at most one retry; no process, owner or request reset. Positive authenticated owner/controller receipts must establish that the payload never started. Missing output, rows, receipts, an exec error or Job/Pod status alone is insufficient. Started/uncertain-spawn payloads, post-spawn failure, preemption, restore, unknown timeout, scientific timeout/cap or wrong answer fail closed.

Preserved limits. Eligibility is not admission. Live-owner reconciliation, unchanged inputs/instrument, remaining authenticated ledger and frozen bindings remain required. All partial work, failures, controls, warmups, replay, diagnostics, owner work, collection/recovery and active reporting remain charged. Unknown accounting blocks admission. The 25,200-second ceiling and 06:00 UTC deadline remain unchanged.

Counter scope still needs precision. The addendum attaches the counter to the same exact prepared execution. This could mean two attempts per each of 18 gate slots, rather than two for the whole gate/controller request. Bind the intended unit to actual launcher semantics: whole gate, worker job or individual prepared execution. This review does not infer the broader allowance. The precise authenticated launch boundary and receipt verifier also remain source-binding obligations.

Scientific boundary. The changed-instrument gate remains expressly unapproved. This clarification does not reopen the known C1 stop. All original failures and full cohort/gate denominators remain retained. The collection reserve is a scheduling proposal, not a measured duration or completion guarantee.

Disposition. The never-started, failclosed and accounting clarification is supported as document wording. Counter granularity and actual enforcement remain pre-freeze obligations. No canonical freeze, execution admission, build, scientific run or cloud action was performed.

Evidence: review.json, custody.json, prospective PLAN.md and overview.svg. This packet is an additive review; it modifies neither preceding proposal nor preceding review.
