Retained read-only pencil runtime observations

Task T-1435. 3 November 2026.

Namespace overview	No pencil Job in returned list
Exact C1 state / controller	Fresh read; retained October30 failure
Pencil state-object listing	14 historical objects; none after new plan
Accounting / admission	Balance unknown; execution not admitted

Retained observations only; no new cloud calls or scientific execution. T-1435.

The existing connector overview returned two isolab Jobs and no Job whose name contains pencil. The original C1 recovery-status request was rejected because the helper does not support its memory field. Separate exact S3 and controller reads succeeded. These observations are retained as different checks with distinct coverage; none supplies a worker-time ledger or execution admission.

The exact C1 state was freshly read from S3, but its event is historical: LastModified2026-10-30T07:54:06UTC, VersionId _dS372y1JUdgqOwWIIGTCcb7AEu2uPhQ,5383bytes. It records phase failed, CRIU dump failure at generation19, retained generation18, and request92897e1dc5fb7fb10b3df9eceeed01aa88ea083b5a67be1431e915bf3231d907. Fresh retrieval does not turn the October30 event into a November3 execution.

The saved worker instance is i-04d58c2b309fb6549 and Pod UID is3a7ab215-49d1-4982-8c78-5a0c71646842. The exact EC2 lookup returned an empty array. That establishes the returned query result, not an exact termination timestamp or zero historical charges. The exact controller2fe8ec79-1f54-4abe-8ec4-151b50b1178b read reports FAILED, buildComplete true, and end2026-10-30T07:54:08.858UTC. Controller completion is separate from payload accounting.

The retained S3 listing contains14 pencil state objects across the original p739, p739-a1, p186379-b1 and p186379-c1 lineages. All14 LastModified timestamps are October30, and none is after the November3 planning record. This is a statement about the returned listing, not a proof of no activity outside those objects or complete consumption accounting.

The latest planning record allows25200 cumulative active-worker seconds through2026-11-04T06:00UTC, with execution_authorized_by_this_record false. Spent time, remaining credit and outstanding reservations remain unknown here. Earlier campaign costs and failures are preserved. The connector overview's configured capacity fields are not live NodePool or quota validation. The earlier separate kubectl authentication denial remains a valid observation of that path; these successful reads do not retroactively change it.

Provenance. Root produced the retained readbacks; this delegated archival step performed no remote queries, scientific run, cloud mutation or permission change. Raw files and exit codes are preserved and hashed. Local file modification times are recorded only as retention metadata; remote LastModified/start/end values retain their original event meaning. JSON and CSV give explicit observation scope and unresolved conclusions. Root handles accounting and prospective admission separately.
