p prime >=5; gcd(t,p)!=1
Explicit Hasse premise t^2<=4p
Arithmetic forces t=0
Any integer r>2
r divides #E=p+1
p=-1 mod r
Exact modular order2
No r-prime assumption
control
Actual positive control
E/F7: y^2=x^3+x, #E=8
P=(3,3), order(P)=8
order(7 mod8)=2
