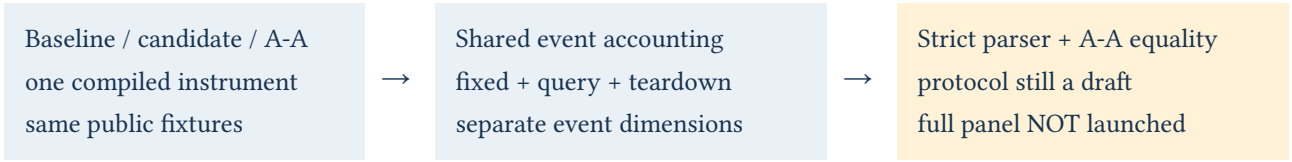
Matched monomial accounting instrument

2026-11-07 · Development validation; comparison not launched

The compiled instrument places four-column baseline, combined-monomial candidate and identical-baseline A/A under one counter and allocator implementation. Public exponent primitives and fixed-object teardown are now explicit. [pcc:unverified]



What was checked

Both 15-module generated arms pass exact forward/reverse source checks and 30 corruption rejections each. One selected native test checks identity and an exceptional public target: results, A/A, stage placement, unchanged geometry/decoder/verification arithmetic and teardown/exponent events. It passes; 414 imported tests are filtered. The release binary compiles and describe mode executes no kernel. Three synthetic parser methods pass, including a setup regression that reverses a query reduction. [pcc:unverified]

Accounting semantics

The 14 stages, 12 components and 17 event slots retain fixed compilation, calibration, preparation, initial/extra geometry, transport, residual, decoder and forward verification. Fixed object destruction is charged explicitly. Analysis adds the complete fixed cost to every query. Execution is grouped by arm; output is interleaved by target. A/A must match exactly. These are helper-event dimensions, including distinct moduli, not a weighted field or machine-cost model. Allocation bytes are cumulative volume, not peak or net memory. Harness formatting and input parsing are excluded.

Admission and next work

The full 20-target mode has not run. Protocol is an unvalidated, unfrozen draft: canonical validator unavailable, source publication binding and external capture/export wrapper outstanding. Proposed envelope: one CPU, 1,024 MiB, 120 seconds, one attempt, USD1 including all overhead. Reserved funds: zero. Verify remaining budget and live capacity before submission. Original 4,563-case cohort unchanged; no cloud job or timing panel.

Provenance

Compiler version and host description were captured before build. Source/data locks, exact instrumentation maps, raw development logs, release binary hash, analysis lock and draft protocol are saved. Parser requires successful external-process receipt, raw hash and frozen protocol hash; output uses exclusive creation. Claim PCC-20261107-2e7492 remains unsigned (local verdict not_covered).

Sources checked (KB): MCP/wrapper unavailable; predecessor transport-accounting generator/meter, monomial-recovery source and factor-matched protocol/parser patterns. No new mathematical or novelty-priority claim. Next: finish admission bindings and export support, then compare all fixed targets without selecting favorable outcomes.
