Graph find gate repair

The new gate propagates native failures and creates a fresh evidence directory per invocation. The original mathematical source bytes remain unchanged.

Successful replay. Find, Controls and Readback each returned zero; gate exit zero.

Failure control. A deliberate false equality returned native exit one and gate exit one. Both invocations preserved input hashes.

Evidence custody. Local source snapshots and compiled outputs, commands, stdout/stderr and atomic terminal receipts are retained. Original producer receipts were not altered. Historical wrapper success alone is insufficient; individual native receipts and readbacks remain authoritative. Independent review is pending publication.
