Branch v2 partial native result

Thirteen compiler calls passed; call fourteen, BranchRootMultiplicity, failed at lines 86, 99, 117 and 146. The errors concern a local evaluation-map definition, a local multiplicity abbreviation, finiteness of an ENat product and unreduced local bindings before rewriting. Raw stdout retains sorryAx in three failed helper readbacks.

The remaining four calls (BranchCoefficientMultiplicity, IndependentControls, Readback, ExpectedFailure) were not reached. The final thirteen-name audit has no result. Passed predecessor outputs are separately inventoried; this does not turn failed helpers into accepted theorems.

Pre/post dependency inventories match: 16736 files, 3111892318 bytes. Frozen source and runtime hashes match. All fourteen compiler processes were reaped and all three phase owners were confirmed terminal.

Precheck took 103.900758595 seconds, compiler phase 397.613413084 seconds, postcheck 30.453651350 seconds. Total attempt 532.083335616 seconds. Full charge 3600 seconds; cumulative campaign charge 16260 seconds. Limits: one CPU, 8 GiB, no swap, 128 tasks. These are wall durations, not CPU measurements.

Every native and outer file is archived unchanged, including compiled predecessor files and failed stdout. Hashes were checked before and after archival. No compiler rerun or independent kernel check occurred. Pre/post hashes do not exclude transient concurrent changes.

Branch v2: recorded compiler outcomes

13 passed 1 failed 4 not reached

Final 13-name audit: not reached

Recorded native outcomes; no compiler rerun by archivist.
