Continuation reconciliation and remaining bindings

Nine retained plan hashes match: 1260 enrolled targets, 22680 slots and 3780 warmups, plus the separate 18-slot upper gate. All 24 retained controller/progress/owner source entries match. These files can be reused under their remaining package and runtime bindings.

Known data preserved. C1 contains seven records, four measured and three warmups; two pencil timeouts, zero verified pencil outcomes and eleven missing slots remain. The retained independent review reports 36 null qualified ratio cells. No missing work is replaced with a successful record.

Budget. The authorization remains 25200 cumulative active-worker seconds with absolute deadline 2026-10-31 06:00UTC, planning-only. Spent, outstanding reserved and remaining worker allowance remain null. No complete authenticated current campaign ledger was obtained. Calendar time and missing Jobs cannot supply that balance.

External state. MCP overview found no pencil names among 49 isolab Jobs. This does not cover recovery-system controller ownership. Exact historical recovery status failed on an unsupported memory field; a source-checked, status-only projection also failed decoding that field. Both failures are retained; original request bytes remain unchanged. No new role, submission or restart was used.

Concrete joins. The structured ledger contains 19 fields covering actual owner/charge closure, final binary and counter equivalence, runtime/publication receipts, request and session identities, original p739 row compatibility, timing, analysis, prospective decision and canonical review/freeze. Unobserved runtime IDs remain null. The known-C1 stop and full cohort scope remain.

No scientific trial, replay, cloud mutation or generator restart occurred. Root continues final binary/image work separately. The proposed 05:30 payload cutoff and 1800-second reserve remain prospective; the absolute 06:00 deadline is unchanged.
