Source-bound centered terminal dataset

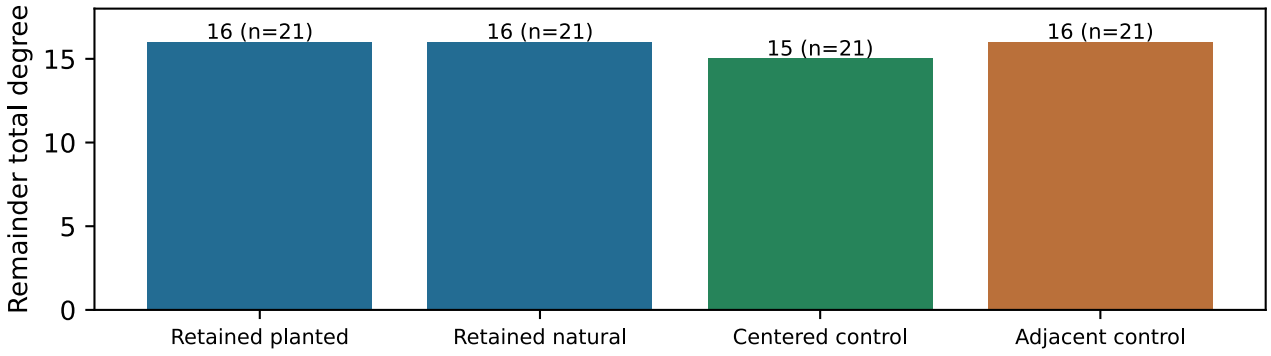
Run n83-centered-panel-20261030-r2 · T-1008 · 30 October 2026

All 84 source-bound prime n83 m3–9 cases completed production, fresh native replay and replay after S3 restoration. The producer records 21 centered-target remainders of degree 15 and 63 other remainders of degree 16. Every alternating projection is nonzero. All 872 final payload hashes match after restoration, and the unified export passes its frozen protocol and file checks.

Dataset and recorded arithmetic

The three retained arms are original, baseline and spike40. Each includes seven m values and four target origins: retained planted, retained natural, synthetic centered and synthetic adjacent. Every wrapper binds the complete original input/source, effective source and fixed factor-base manifest. The derived controls change only the terminal target and remove inherited target-point claims; no rational lift is asserted for them.

The native construction centers the last selector block, expands P and the reduced products XP and X^2P, and retains all three full coefficient polynomials of the terminal remainder in unrestricted U. Its alternating projection is compared exactly with the derived formula. It writes A0/A1/A2 and F0/F1/F2 in the N83CEN1 codec, plus input, certificate and manifest files for each case.



All 84 recorded cases. Within each target-origin group all degrees agree across arms and m. These are terminal-remainder degrees, not regularity values; fixed correlated constructions carry no statistical interval.

Execution, identity and replay

The separately frozen local fallback used the identical prepared inputs and instrument after the original EKS attempt became terminal with no arithmetic output. Native source: `a27e8321d7f12657d98732a8d7ca972095fa3d56`. Protocol v2 hash: `cd0e2cc82c7d967e0482adc55053f5f55175f5d347d411ae93832126c9b671cc`.

The existing shared host ran two 600-second phases with 2 GiB address-space limits and a 1,500-second whole-worker cap, without retries. Worker timestamps were 21:55:27–22:04:27 UTC. Wall time is invalid for performance comparison. Producer and replay exited 0, and the outer launcher exited 0 after upload. The restored executable subsequently verified all 84 cases again.

Final AWS download returned exit 2 for five temporary transfer paths that disappeared during traversal. That original warning log remains. Checking the completed files directly verified all 872 manifest entries; the restored native replay then passed. The restored manifest itself is byte-identical to the producer manifest. No failed download observation was discarded or called an arithmetic failure.

Custody and use

Raw data: `s3://setec-astronomy-artifacts/runs/n83-centered-panel-20261030-r2/raw/`. Git records are under evidence/centered-panel-r2: summary.json, certificate-index.json, custody.json, phase rows/logs, manifests and restoration logs. CENTERED_PANEL_R2_FORMAT.json describes the run layout; CENTERED_WITNESS_FORMAT.json defines polynomial bytes. The original EKS failure and inspected report remain under evidence/centered-panel-r1 and reports/run-20261030T2121Z-centered.

This dataset verifies the concrete centered arithmetic and exact source/base binding. The previously reviewed filtered-space argument is a separate mathematical dependency of fall-degree conclusions; these records keep exact LFD and regularity null. The point bases remain unchanged. Next use the retained full coefficients in upper-bound/stabilization work and in source-bound comparisons with genuinely different candidate-domain constructions.
