Frozen original RR input:23 variables,25 quadrics/linear rows
Exact original bytes preserved; m=5,t=4,seed2
Keep only a1,a2,c0,c1
C=c0+c1 X; target row uniquely determines a0
Actual target-completed A; N=A^2-f C^2
N divisible by X-r; U=N/(X-r), monic degree5
Monic division uniquely recovers Q3,R3,Q4
Remaining condition: R4=0, five coefficients
Substitute recovered lift into all25 original equations
20 vanish identically; last5 equal the reduced constraints
Recorded trade:4 variables,5 polynomials,degree24
Expanded input191962 bytes; original1554 bytes
Supplied plant + four fixed perturbations agree
Bad auxiliary rejected; no coefficient/branch/log search
OPEN: solve the structured reduced constraints efficiently
No solver-cost gain or sub-exponential bound established
