Prime-field ECDLP target Q
Generate O(n) labelled points online; all costs charged
Signed point relation
Written principal-divisor / prescribed-norm equivalence
Structured linear coefficient equations
PLUS nonzero rank-one constraint
Drop rank one: linear shortcut FAILS
F17 curve y^2=x^3+2x+2; 19 points
U=11, V=9: norm residual2X^2
Retain rank one: witness search unresolved
Required bit cost2^{o(n)}, not established
No novel sub-exponential algorithm obtained
Formal result is the exact shortcut counterexample
