R113: second blowup of the x=0 wild edge

5 November 2026 | exact marked-23 degree-7 base equation

Set y=1+x+x^2(1+v); divide f51 by x^6.

The 34-term quotient has special fiber v^2(1+v).

Its lower hull: (0,3), (2,0), (3,0), (7,8).

Positive slope 3/2 has residual 1+T^2.

The residual is (1+T)^2, repeated in characteristic two.

Next: set x=r^2, v=r^3(1+h) and lift higher terms.

Fresh replay, altered-source rejection, independent R112 composition: pass.

Lean finite support arithmetic: pass.

The normalized place count and N51 valuations remain open.
