Schur panel: original cap reached

Terminal incomplete-run report · 2026-11-01T22:42:11.515704+00:00

The single Schur invocation reached its original 3,600-second cap and returned 124. Its postprocessor recorded the same terminal result and stopped before analysis/export. Both process handles are absent. No restart or budget extension occurred. The frozen complete cohort remains 642 context rows.

Complete Schur context receipts: 42 of 642

37 verified constructions; 5 leading-block obstructions

600 planned rows have no completion receipt. No full-panel verdict.

Counts derive from every complete raw JSON line. The terminal reconciliation retains full and prefix hashes, byte counts, row IDs and all observed branches.

Retained evidence. 42 completed context rows contain 37 checked Schur constructions and 5 certified leading-block obstructions, with 456 directional product checks and 1903 rejected corruption controls. These are observations on the completed prefix. A/A and the synthetic control cohort did not complete. The planned 96 invertible-full/blocked-leading controls are not claimed as executed. The frozen analyzer was not forced onto this incomplete archive.

Coverage and custody. 600 planned rows lack a completion receipt; the exact number of started but unfinished contexts is not recorded. All 815,403,674 raw bytes remain, including 0 trailing partial bytes. Eleven frozen source locks and the public input lock reverified. Predata f5cac20; protocol 7403509a477e478f03427db64fd4c864e8e62ea99dba3f5d84f8bcd249204480. The full source, log, native descriptors and original deadline receipts are preserved. Previous launch reports remain historical observations.

Completed construction examples. These are generator-construction costs; source application work and supplied reference-inverse work remain separate.

- Source 18, r=359, cut=179: 37,001,952 field products, 103,032 native integer products, 295,907,904 packing bytes; 322 reference leading solves and 10,317,202 dense reference terms.
- Source 27, r=479: certified leading-block obstruction; no complete Schur generator.
- Source 36, r=683, cut=341: 163,410,762 field products, 239,112 native integer products, 1,306,507,968 packing bytes; 490 reference leading solves and 56,977,690 dense reference terms.

Next technical step. The per-column construction invokes the full source operator 2s+6 times. The separate companion-fused candidate defers polynomial coefficient reduction through extraction, wrapping and accumulation. Its larger radix and extra native arithmetic must be checked and charged before it can replace a source operator. That candidate remains unexecuted at this report's preparation. No change is made to this capped instrument.

Files. terminal-reconciliation.json; producer.log; exit-code.txt; postprocess-state.json; postprocessor-exit.txt; runs/cases.jsonl; source-lock.json; input-lock.json; launch.json; protocol.json. Chart data, editable report source and renderer accompany this PDF. No full-panel export or solver improvement is inferred from the retained prefix.
