Public curve and 2a distinct abscissas
Chosen branches z(x)²=f(x)
Actual barycentric Hankel matrix
M(j,k) = sum w(x) z(x) x^(j+k)
Dimension (a-1) x (a-1)
det M=0 -> nonzero kernel vector
ofFn gives bounded B
Branch change at t
M_new-M = delta*w(t)*v(t)*v(t)^T
search rule missing
Construct s by public interpolation
A = sB mod G; moment test gives deg A <= a
Open: choose signs to reach det M=0
Charge all visits and preserve target branch
Full nonzero norm A²-fB² = cG
No supplied successful A/B or moments
