Expanded curve-cover catalog assessment

Validation addendum, 23 October 2026

Source catalog. Commit `cf3fad47b02159e018c2a6329fadd5213f9aa40e` fixes the three catalog files. The current inventory contains 15,990 map rows, 15,988 unique cover objects, 735 declared fields, 15,988 Jacobian contexts, and 700 linked EC1 representations. The catalog checker records 15,990 verified maps, zero invalid inputs, and zero unsupported inputs. The assessment assigns a base profile to all 15,990 maps and a subgroup profile to all 700 linked triples; "assessed" means each claim has an explicit status, not that all capabilities are supported.

Map profile	Rows	Full transfer pipeline
Binary cubic, same field	186	unavailable
Odd prime, direct quadratic	14,403	unavailable
Odd prime, normalized quadratic	30	unavailable
Odd extension, direct quadratic	1,371	unavailable
Total	15,990	unavailable

Linked subgroup inventory. The 700 linked EC1 representations comprise 141 binary degree-three triples and 559 odd-characteristic degree-two triples. The binary profile records bounded generator-level typed identities; the odd-characteristic profile does not supply compatible induced maps.

Provenance and verification. The catalog adds 13,219 prime-field models relative to the previous 2,771-row inventory. The dated registry audit records source bindings, order certificates, and their stated limits. At the catalog commit, `curve_cover_check -check` returned `verified=15990`, `invalid_input=0`, and `unsupported=0`. The generated assessment is byte-exact under `build_cover_transfer_assessments.mjs -check`; the independent `verify_assessment.mjs` reconstructs the model, map, cover, field, and Jacobian joins, replays the declared cover equations, and SHA-binds this report and its figures.

Boundary. The 186 binary maps have bounded typed point-class operations. The 15,804 odd-characteristic maps have cover geometry without a compatible balanced two-infinity Jacobian transfer. No complete catalog transfer pipeline, discrete-log cost improvement, or wall-speed result is established. The conditional Lean group lemma does not import this catalog. The older packaged release replay covers a smaller bundled registry and is not a replay of all 15,990 current inputs.
