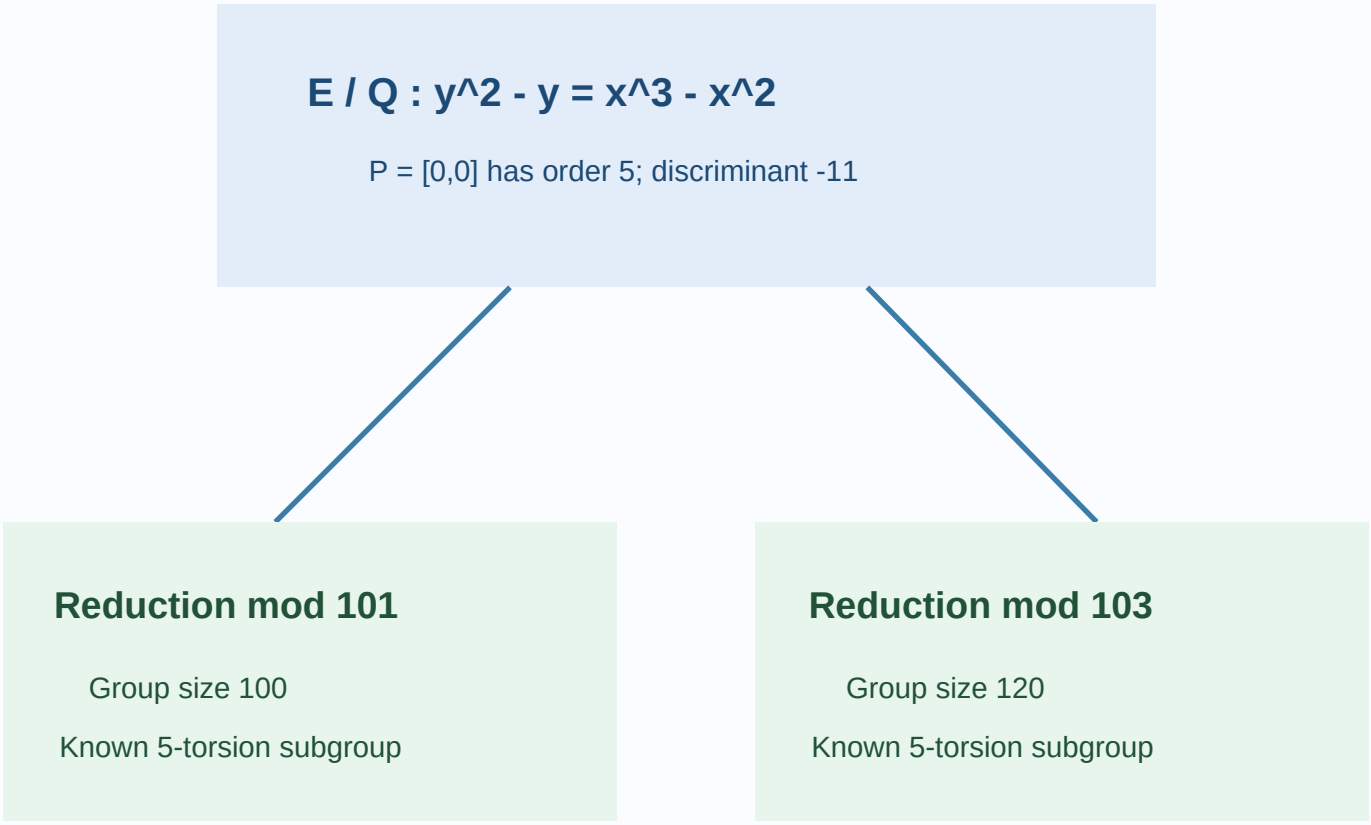
CT38: Global rational torsion bridge

Bounded cross-characteristic positive control - pcc:unverified



This is NOT a field map or a map on arbitrary elliptic-curve inputs.

Arithmetic controls

Python and independent Go: E(F7)=10, E(F13)=10, E(F17)=20. E(F101)=100; E(F103)=120; every torsion group-law pair checked. Negative: [2,29] is on E(F101), but not on E(F103).

Unresolved research gate

Efficient global lifting of arbitrary large-order inputs into a common dimension g >= 2 abelian variety and complete solver costs.

Source: isogeny-labs/crypto PR #3988 - local arithmetic only; no speedup.
