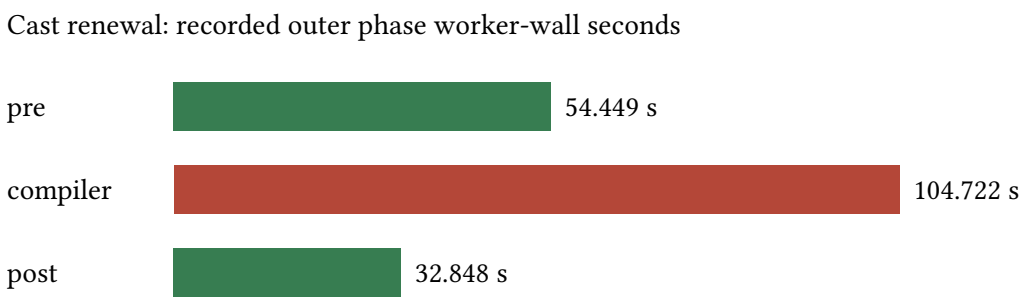
Cast renewal: terminal compiler qualification

[pcc:unverified] T-2103; retained attempt, November11,2026. This report archives existing output; no compiler, test or solver was rerun.



One retained attempt; all3 phase owners confirmed terminal. No timing comparison.

Recorded outcome

BranchRootMultiplicity and BranchCoefficientMultiplicity compiler calls exited0. IndependentControls, the third call, exited1: lines22 and28 each report “simp made no progress.” The final13-name Readback and ExpectedFailure calls were not reached. The overall completion is failed and machine review incomplete. The coefficient module’s own stdout reports propext, Classical.choice and Quot.sound. That local output is preserved as a component observation; it is not the unreached final readback or a complete controls result. Independent analysis of exact claims remains separate.

Custody and measured durations

The pre phase passed in54.44882508798037 worker-wall seconds, compiler phase failed in104.72157733800123, and post phase passed in32.84840777597856. Outer elapsed was192.1372683380032seconds. These are one-attempt worker-wall observations, not CPU time or comparative performance estimates. All three outer records confirmed terminal ownership. Pre/post dependency, retained-import and runtime manifests are byte-identical.

Accounting and preserved scope

The full600second conservative reservation is charged, leaving129000worker seconds in the renewed129600second campaign. Historical charges remain separate and unchanged. No cohort targets ran; complete cost ratios remain null. The full1260target scientific scope is unchanged.
