Controls successor: independent source review

[pcc:unverified] T-2105. No compiler, test or payload run. Final source status: no remaining blocking source finding; kernel outcome unverified.

T-2105: exact controls correction review

Remove two no-progress simp steps; retain statements and ring

Keep5 calls /13 names /26 imports and600second ceiling

R1 repaired:600 +129000 =129600; original snapshot retained

Mathematical source delta

Only two simp only[Polynomial.C_ofNat] calls are removed after bare norm_num in valid_first and valid_second. Native failure stdout records no-progress errors at those locations. The theorem statements, witnesses, final ring calls, source-instance control and adverse controls are unchanged. The separate bezout simp is retained. This addresses the recorded tactic interruption; no compiler success is inferred.

Operational correction and rereview

Initial launcher had contradictory assertions: prior600,remaining129000,but sum129000. R1 blocked every intended release. Root preserved initial launcher/freeze/manifest/patch and corrected only the sum bound to129600. All repaired freeze and manifest entries match. Initial freeze94c593ca00cc87d1f3caca8ddcaeec708317cbfacec32a295d00842e8e92ff9a; corrected d20691095b0e6f932a5f34f9107e09c56629b57da85ea94dea35c007d87f3a40.

Preserved scope and next boundary

Five calls,13names,26retained imports, dependency custody/runtime pins,600seconds split180/240/180,1CPU8GiB/zero swap128tasks and no automatic retry remain. Deadline November11noonUTC and campaign129600 retained; historical600charge remains. Independent review does not release execution; publication and final live bindings remain coordinator responsibilities. Reviewer authored old coefficientData specialization, not these controls or successor. Non-blind delta review; primary sources are exact candidate/predecessor and failure stdout. KB unavailable; no novelty claim. See PLAN.md, REVIEW.md, review.json and review.csv for source pins and initial finding.
